

Supplementary Figure 2

Supplementary Figure 2. Relationship between IGFBP-3 mRNA and CD44 mRNA levels in HCC1806 clones with varying IGFBP-3 expression. Total RNA was extracted from duplicate cultures, reverse-transcribed and analyzed by qRT-PCR in duplicate as previously described (13). Data points for each mRNA species were expressed relative to a single low-IGFBP-3 clone (B10) and were fitted using a 4-parameter sigmoid logistic curve.
