

Supplementary Methods

Data Acquisition and Preparation

Drug dose response data were downloaded from the CCLE (February 20, 2012; *CCLE_NP24.2009_Drug_data_2012.02.20.csv*) and CGP (Release 5, June 2014; *gdsc_drug_sensitivity_raw_data_w5.csv*) repositories and parsed to find matching cell line names. Original data files available upon request. As some cell lines have multiple names, several of the cell lines were matched manually to ensure maximal correspondence between the two databases. This identified 285 shared cell lines between CCLE and CGP (*CreateIntDataSheets.m*). The data were also parsed according to shared drugs (15). Viability values from CCLE were converted to percent viability by simply adding 100 to each value. In CGP, viability values possessed corresponding drug-free control wells (cells only) as well as drug- and cell-free wells. Viability values from CGP were converted to percent viability by subtracting the mean value from drug- and cell-free wells, dividing by the mean value from drug-free wells (which also has the mean value from drug- and cell-free wells subtracted), and then multiplying by 100.

Defining the Shared Dose Range

CCLE and CGP use different drug dose ranges. All drugs in CCLE have eight doses between 8 μM to 2.5 nM. Drugs in CGP each have different drug dose ranges for a total of nine doses, prepared by two-fold serial dilution. Because we wanted to compare the two databases within a similar drug dose range, the shared dose range boundary data points from each database were defined such that (i) the maximum number of data points from each database were used and (ii) the boundary data points from each database were as close to each other as possible (*FindSharedDoseRange.m*).

Calculation of Slope (m) and Area Under the Curve (AUC) Values

We calculated slope using the `polyfit` function and AUC using the `trapz` function in MATLAB. The x-values corresponded to \log_{10} dose values. Because different drugs possess different drug dose ranges, we normalized slope and area under the curve to facilitate their comparison (*Calculatems.m* and *CalculateAUCs.m*, respectively). To normalize slope, we multiplied by the difference between the \log_{10} of the maximum and minimum drug dose within the shared dose range, and divided by 100. To normalize AUC we divided by the difference between the \log_{10} of the maximum and minimum drug dose within the shared dose range, and divided by 100.

SVM Machine Learning

The SVM classifier was trained with the MATLAB function `fitcsvm` (The Mathworks, Natick, MA) using a linear kernel. Predictors were the m_s and AUC_s measurements and the class labels were the average of the eight manual curator ratings of sensitivity or insensitivity rounded to the nearest integer (majority rules model).

Re-Calculating IC_{50} Values

IC_{50} values were re-calculated for every dose response curve in CCLE and CGP that was classified as sensitive in either database for the shared dose range only. A hill function was fit to the data using the MATLAB function `lsqcurvefit` and an IC_{50} was calculated

only if the hill function crossed the 50% viability line within the shared dose range, and otherwise omitted (`CalculateIC50SharedRange.m`).

Randomizing Dose Responses for Manual Curation

All of the dose response curves from the shared cell lines and drugs in CCLE and CGP (2520 curves from each study = 5040 total curves) were randomized such that each curator rated them in a unique order, using the MATLAB function `randperm`. Each curve was given a unique sequence of numbers that identified which database it was from and which cell line and drug was used. The manual curators were not given the key. The curators were only shown data that fell within the shared dose range (see Extended Data Figure 2 for an example page).

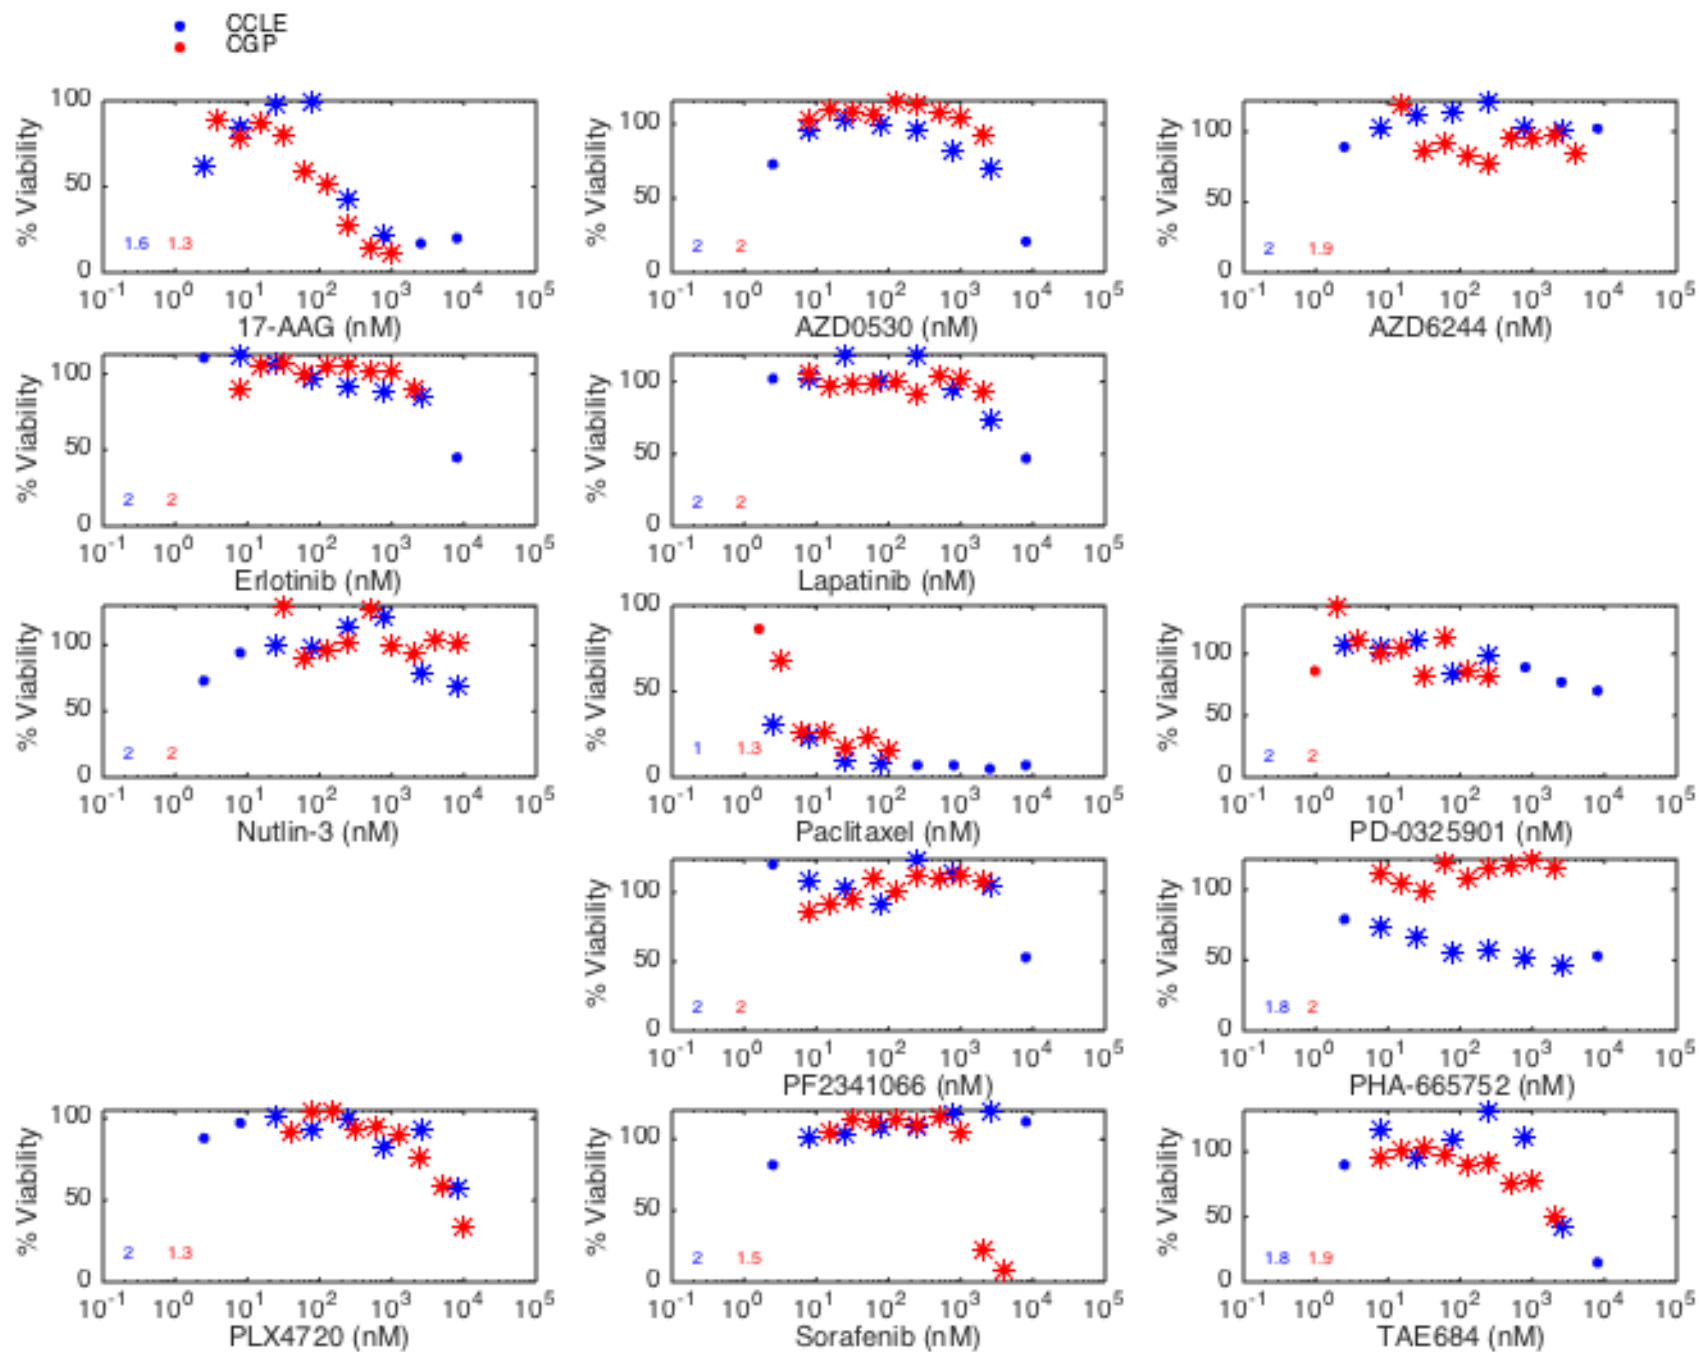

Producing Figures

All data analysis and figure preparation was done using MATLAB. The main figures can be reproduced using `FiguresMain.m` and the extended data figures using `FiguresExtendedData.m` which make use of custom made functions as well as a few downloaded from others^{1,2,3}. All scripts and data needed to reproduce the figures are supplied as Supplementary Data File 2.
