Supplementary Table 1: (A) Definition of QMG score, (B) Osserman classification, (C) MG-ADL score and (D) MG-MMT scores.

| A) QMG score [Barohn R                      | Interpretation           |   |   |                      |  |  |
|---|--------------------------|---|---|----------------------|--|--|
| Indicators tested                           | None                     | Mild  | Moderate  | Severe               |  |  |
| Level                                       | 0                        | 1   | 2   | 3                    | Maximum score: 39  |  |
| Onset of diplopia gazing right or left (s)  | 61                       | 11–60   | 1–10  | Occurs spontaneously | Decrease in QMG score represents improvement in symptoms |  |
| Onset of ptosis gazing upwards (s)          | 61                       | 11–60   | 1–10  | Occurs spontaneously |  |  |
| Eyelids                                     | Normal closure           | Complete closure,<br>some resistance to<br>forced opening | Complete closure, no resistance to forced opening | Incomplete closure   |  |  |
| Swallowing 4 oz water                       | Normal                   | Slight cough or throat-clearing                           | Severe coughing/choking or nasal regurgitation    | Unable to swallow    |  |  |
| Onset of dysarthria counting from 1 to 50   | None when counting to 50 | Dysarthria at 30–49                                       | Dysarthria at 10–29                               | Dysarthria at 9      |  |  |
| Right arm outstretched (90 degrees sitting) | 240 s                    | 90–239 s  | 10–89 s   | 0–9 s                |  |  |
| Left arm outstretched (90 degrees sitting)  | 240 s                    | 90–239 s  | 10–89 s   | 0–9 s                |  |  |
| Lung capacity (% predicted)                 | ≥80                      | 65–79   | 50–64   | <50                  |  |  |
| Grip strength R (kg)<br>Male<br>Female      | ≥45<br>≥30               | 15–44<br>10–29  | 5–14<br>5–9                                       | 0-4<br>0-4           |  |  |
| Grip strength L (kg)<br>Male                | ≥35                      | 15–34   | 5–14  | 0–4                  |  |  |

| Female  | ≥25                        |                                  | 10–24                                    |                               | 5–9  |  | 0–4                                   |  |   |
|---|----------------------------|----------------------------------|--|-------------------------------|--|--|---------------------------------------|--|---|
| Head lifted (45 degrees supine)                   | 120 s                      | ) s                              |  | 30–119 s                      |  | 1–29 s   |                                       |  |   |
| Right leg outstretched (45 degrees supine)        | 100 s                      | 00 s                             |  |                               | 1–30 s   |  | 0 s                                   |  |   |
| Left leg outstretched (45 degrees supine)         | 100 s                      |                                  | 31–99 s                                  |                               | 1–30 s   |  | 0 s                                   |  |   |
| B) Osserman classification                        | n [Osserman, 1958          | 3]                               |  |                               |  |  | •                                     |  | ,   |
| Classification                                    | 1 2                        |                                  | 3  |                               | 4  |  |                                       | 5  | A decrease in classification                                  |
| Description                                       | Ocular involvement alone   |                                  | d muscular<br>akness                     | Moderat<br>muscula<br>disease | ar   | Incapacitatin<br>weakness of<br>any muscle<br>system | _                                     | Life-threatening respiratory insufficiency | denotes improvement in disease                                |
| C) MG-ADL profile [Mupp                           | oidi <i>et al.</i> , 2011] |                                  |  |                               |  |  |                                       |  |   |
| Grade   | 0                          |                                  | 1  |                               | 2  |  | 3                                     |  | Maximum score=24  |
| Talking   | Normal                     | Intermittent sl<br>or nasal spee |  |                               | Constant slurring nasal, but can be understood |  | Difficult to understand speech        |  | A decrease in MG-ADL score denotes an improvement in symptoms |
| Chewing   | Normal                     |                                  | Fatigue with solid food                  |                               | Fatigue with soft food                         |  | Gastric tube                          |  |   |
| Swallowing  | Normal                     |                                  | Rare episode of choking                  |                               | Frequent choking necessitating changes in diet |  | Gastric tube                          |  |   |
| Breathing   | Normal                     |                                  | Shortness of breath with exertion        |                               | Shortness of breath at rest                    |  | Ventilator dependence                 |  |   |
| Impairment of ability to brush teeth or comb hair | None                       |                                  | Extra effort, but no rest periods needed |                               | Rest periods needed                            |  | Cannot perform one of these functions |  |   |

| Impairment of ability to arise from chair | None   |   | Mild, sometimes uses arms                |  | Moderate, always uses arms |                                  | Severe, requires assistance |  |  |
|---|--------|---|--|--|----------------------------|----------------------------------|-----------------------------|--|--|
| Double vision                             | None   |   | Occurs, but not daily                    |  | Daily, but not constant    |                                  | Constant                    |  |  |
| Eyelid drop                               | None   |   | Occurs, but not daily                    |  | Daily, but not constant    |                                  | Constant                    |  |  |
| D) MG-MMT scores [Sanders et al., 2003]   |        |   |  |  |                            |                                  |                             |  |  |
| Score                                     | 0      | 1 | % weak/mild 50% pairment weak/moimpairme |  |                            | 3                                | 4                           | Sum scores for 30 muscle groups.  Decrease in MMT score represents improvement in symptoms |  |
| Description                               | Normal |   |  |  |                            | 75%<br>weak/severe<br>impairment | Paralysed/unable to do      |  |  |

FAS, full analysis set; L, left; LOCF, last observation carried forward; MG-ADL, myasthenia gravis-related activities of daily living; MMT, manual muscle test; R, right; QMG, quantitative myasthenia gravis.
