

Supplement

See Supplement Figure and Supplement Figure Legend.

Supplement Figure Legend: For the NYU-CIBIC-Plus primary outcome assessment, data for one subject, who had been randomized to the Usual Community Care + Financial Compensation (UCC+FC) (comparator) group was excluded because of a data quality concern. Herein, we present the outcomes with the inclusion of the previously excluded UCC+FC subject. The Supplement Figure shows the results for the 20 subjects. For the NYU-CIBIC-Plus, baseline is set at 4. Consequently, per the design of CIBIC-Plus scales, there are no between group differences at baseline. Scores of 1, 2, and 3 correspond to “markedly,” “moderately,” and “minimally” improved, respectively, a score of 4 indicates “unchanged,” and scores of 5, 6, and 7 correspond to “minimally,” “moderately,” and “markedly,” worse, respectively. Beginning with the first post-baseline evaluation at week 4, the Comprehensive, Individualized, Person-Centered Management (CI-PCM) program (intervention), subject group (N=10), showed improvement, whereas the UCC+FC comparator subject group (N=10), showed decline. Between group differences were robustly significant at week 4 (intervention 2.6 ± 0.4 [SE], comparator 4.4 ± 0.4 [SE], $p < 0.01$), week 12 (intervention 2.2 ± 0.3 [SE], comparator 5.0 ± 0.5 [SE], $p < 0.01$) and week 28 (intervention 2.3 ± 0.4 [SE], comparator 5.3 ± 0.5 [SE], $p < 0.01$) observation periods.

Supplement Figure: The New York University Clinician's Interview Based Impression of Change-Plus Caregiver Input (NYU-CIBIC-Plus) primary outcome results with the entire, N=20, study population including the subject who had been excluded from the main text analysis because of data quality concerns.

Per design, the baseline NYU-CIBIC-Plus score is set at a value of “4” signifying “no change.” A lower score indicates improvement.

Bars indicate mean (+/-SE) scores at each specified observation period.
