Online Resource 5. Correlation in T-cell receptor variable beta chain protein expression of CD4⁺ and CD8⁺ T-cells expanded from anatomically distinct white matter lesions of the same MS patient.

Short-term T-cell lines (TCL) were generated by non-specific stimulation of T-cells recovered from paired white matter brain tissues that were histologically classified as normal-appearing white matter (NAWM) and white matter lesions (WML) classes; diffuse white matter abnormalities (DWMA), active lesions (AL), mixed active/inactive lesions (mAL) and inactive lesions (IL) (see Online Resource 2 for criteria applied for MS WM classification). The T-cell receptor variable beta chain (TCRV β) protein expression profile was determined for 10 MS patients by flow cytometry using monoclonal antibodies (mAb) directed to 24 distinct human TCRV β chains for CD4 $^+$ (upper rows) and CD8 $^+$ T-cells (lower rows) of the indicated TCL for each MS patient (column pairs). Light to dark color grading indicate the lowest to highest frequencies of specific TCRV β expressed by CD4 $^+$ and CD8 $^+$ T-cells in each TCL. The mean TCRV β chain expression of PB-derived CD4 $^+$ and CD8 $^+$ T-cells from 85 unrelated healthy individuals are provided as reference (data provided by Beckman Coulter). "Undetermined" refers to T-cells expressing a TCRV β chain not covered by the TCRV β -specific monoclonal antibody panel used. Spearman's rank correlation test were used for statistical analysis.
