**Running title:** Epigenetic Aging in Children

**Figure S1.** DNA methylation differences associated with violence exposure. On this Manhattan plot, the x-axis is the position of each CpG site by chromosome, and the y-axis is the negative  $\log_{10}$  of the p-value for association of each CpG site with violence exposure. The black line indicates experiment-wide significance.

**Figure S2.** Scatter plot of DNAm Age and Chronological Age
