Table S2 : Primers used in the study

**Fig. S1 : Expression of the wild-type pIN-pIII-N1<sup>CTX</sup> His-tagged constructs and individual cysteine mutants.** Western immunoblot of 0.2 OD units of whole-cell lysates of *E. coli* DH5 $\alpha$  strain carrying pIN-pIII-N1<sup>CTX</sup>, or cysteine variants pIN-pIII-N1<sup>CTX</sup> C32S, C47S, C75S and C96S, and probed with anti-His antibody. The molecular weight markers (in kDa) are indicated on the left.

**Fig. S2 : Expression and periplasmic transport of the pIII-N1 His-tagged constructs and point mutants of interest.** *V. cholerae* O395 cells carrying pIN-pIII-N1<sup>CTX</sup>, pIN-pIII-N1<sup>CTX</sup> (E37Q D39N), pIN-pIII-N1<sup>CTX</sup> (E92K) or pIN-pIII-N1<sup>M13</sup> were grown to OD=0.3 in LB supplemented with MgCl<sub>2</sub>, then incubated either with (+) or without (-) sodium azide ( $\text{NaN}_3$  1 mM) for 30 min at room temperature. Then, plasmid expression was induced by adding IPTG (100  $\mu\text{M}$ ) and incubating the cultures at 37°C for 2 hrs. A total of approximately 0.2 OD units of whole cell lysate were loaded on a 15% acrylamide gel SDS-PAGE and immunodetected using anti-His monoclonal antibody. The molecular weight markers (in kDa) are indicated on the left. Stars indicate the higher molecular weight bands corresponding to protein precursors that accumulate in the cytoplasm when the sec pathway is inhibited by  $\text{NaN}_3$ .

**Fig. S3 : List of *Vibrio cholerae* isolate genomes used to study TolA sequence conservation.** The TolA protein sequences retrieved from the listed 128 *Vibrio cholerae* isolates present 100% identity.

**Fig. S4: Multiple TolAIII domain sequence alignment of representative members of the gammaproteobacteria family Vibrionaceae genus Vibrio.** The depicted secondary-structure elements correspond to the crystal structure of *V. cholerae* TolAIII (PDB: 4G7X) with β-strands as arrows and α-helices as a cylinders. Positions are colored according to the Clustal color scheme: cysteines in pink, glycines in orange and prolines in yellow; other positions are colored according to conservation of chemical properties: hydrophobic in blue, aromatic in cyan, polar negative in purple, polar positive in red, and polar neutral in green.

**Fig. S5: Multiple TolAIII domain sequence alignment of representative members of the gammaproteobacteria family Vibrionaceae.** The depicted secondary-structure elements correspond to the crystal structure of *V. cholerae* TolAIII (PDB: 4G7X) with  $\beta$ -strands as arrows and  $\alpha$ -helices as a cylinders. Positions are colored according to the Clustal color scheme: cysteines in pink, glycines in orange and prolines in yellow; other positions are colored according to conservation of chemical properties: hydrophobic in blue, aromatic in cyan, polar negative in purple, polar positive in red, and polar neutral in green. Stars indicate the positive charged residues present on the same side of the  $\alpha$ 2-helix.

Non-bonded contacts between pIII-N1<sup>CTX</sup> (Chain A) and TolAIII<sup>Vc</sup> (Chain B) atoms are listed. Contacts engaged by TolAIII residue K324 are colored in red and residue R325 are colored in green.
