**a** Genes and BSU code organized by increasing BSU number.

**b** A few  $\sigma^M$ -dependent genes belong to same operon<sup>10 26,27</sup>, as indicated.

**c** Known  $\sigma^M$ -dependent genes are labelled “+”<sup>10 26</sup>.

**d** Genes reported to belong to the MOE stimulon are labelled “+”<sup>10</sup>.

**e** Fold increase (Fi) in transcription (RNA-Seq data) of genes in strain *Δ4* (AG157) relative to the wild type (168CA), in mid-exponential cells grown in nutrient broth at 37°C. “-“ indicates down regulation.

**f** Around fifty gene deletion strains were tested by MOE-growth assays (growth in LB was monitored for 16h in the presence of 0, 1.25, 2.5, 5, 10 and 20  $\mu\text{g ml}^{-1}$  of MOE). Essential genes were not tested, except as indicated in the Results.
