Title of file for HTML: Supplementary Information

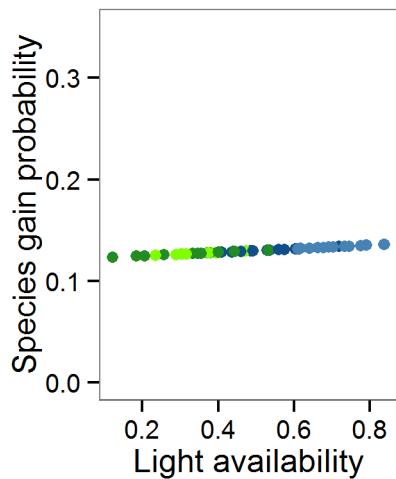

Description: Supplementary Figures, Supplementary Tables, and Supplementary References

Type of file: pdf

Title of file for HTML: Peer Review File

Supplementary Figure 1. Number of lost and gained vascular plants and bryophytes. Change in number of species (means and SE, n=7 for each point) under warming, herbivore exclusion and fertilization treatments between 2009 and 2014. Vascular plant and bryophyte richness at the start of the experiment was 17.9 ± 0.46 and 3.7 ± 0.19 species in $25 \times 50 \text{ cm}^2$ quadrats (mean \pm SE, n=56), respectively.

Supplementary Figure 2. Impact of light availability on species gain probability. Relationship between light availability (measured as proportion of ambient PAR penetrating through vegetation) and species gain probability in fertilization and herbivore exclusion treatments. Fertilized plots are shown in green, unfertilized in blue. Herbivore exclosures are indicated with dark color, grazed plots in light color.

Supplementary Table 1. Impacts of warming, grazing and fertilization on species richness.

Results of ANOVA of effects of treatments and their interactions on change in species richness of all plants (vascular plants + bryophytes), vascular plants and bryophytes between 2009 and 2014. Each treatment combination has 1 numerator and 48 denominator degrees of freedom. P-values <0.05 are considered significant and indicated in bold.

	All plants		Vascular plants		Bryophytes	
	F	P	F	P	F	P

Supplementary Table 2. Impacts of warming, grazing and fertilization on species gains and losses. Results of ANOVA of effects of treatments and their interactions on numbers of lost and gained species of all plants, vascular plants and bryophytes between 2009 and 2014. Number of gained bryophytes were virtually zero and thus could not be modeled. Each treatment combination has 1 numerator and 48 denominator degrees of freedom. Transformed response variables are indicated in footnotes. P-values <0.05 are considered significant and indicated in bold and marginally significant values (P<0.1) are indicated in bold italics.

Supplementary Table 3. Results of logistic regression analysis of tested factors' effects on probabilities of species losses. Summary of logistic regression models predicting effects of species' initial abundance (2009), light availability (proportion of PAR penetrating vegetation) and functional traits on probabilities of species' loss under indicated treatment combinations. Models including functional traits were simplified (see Methods). Number of replicates slightly varies due to missing trait values for some species.
