Supplemental Figure 3. IL-6 activation of STAT3/SOCS3 in human monocytes. (a) Shown are representative immunohistochemistry images of pSTAT3 (brown) detected in human monocytes after 30 minutes treatment in serum free media with defined concentrations of human recombinant IL-6. Nuclei are counterstained with hematoxylin (blue). (b) Expression of SOCS3 in human monocytes incubated for 30 minutes with media alone (Ctrl), IL-6 (100 ng/mL or 0.1 ng/mL), or plasma from a PDAC patient with an IL-6 concentration of 0.15 ng/mL. SOCS3 expression was normalized to GAPDH.
