

Figure S10: Comparison of macroinvertebrate taxa detection between unsorted (Un) and sorted (So) samples. Expected (E) taxa recovery was estimated by combining OTU abundances from S, M and L proportionately. **a)** Amount of OTUs and number of unique taxa identified with OTUs. OTU abundance for each taxon is indicated by color. **b)** Shannon Diversity for each sample. **c)** Proportion of morphologically identified taxa also detected with DNA metabarcoding is indicated by black bars.
