Appendix 1. MEDLINE search Strategy

We searched: Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, EMBASE, PsycINFO, Cumulative Index to Nursing and Allied Health Literature (CINAHL), WHO Global Health Library (in addition to MEDLINE covering African Index Medicus (AIM), LILACS, Index Medicus for the Eastern Mediterranean Region (IMEMR), Index Medicus for South-East Asia Region (IMSEAR), Western Pacific Region Index Medicus (WPRIM), WHO Library Database (WHOLIS), and Scientific Electronic Library Online (SciELO)), IndMED, ISI Web of Science, KoreaMed, EconLit, Paediatric Economic Database Evaluation (PEDE), Google Scholar, the ProQuest database of PhD dissertations, and WHO International Clinical Trials Registry Platform (ICTRP) to identify any ongoing/unpublished studies. No language restrictions were placed on the searches.

Outcome measures and definitions

Primary outcomes:

□ Perinatal mortality (stillbirth + neonatal mortality)

 \Box Preterm birth (live birth at gestational age <37 weeks)

□ Asthma exacerbations requiring hospital attendance (emergency department visit and/or hospital admission):

 \Box Respiratory tract infections requiring hospital attendance (emergency department visit and/or hospital admission:

Specify the outcome definition used by authors: Click here to enter text.

Secondary outcomes:

Mortality:

- \Box Stillbirth (born dead at gestational age \geq 24 weeks)
- \Box Neonatal mortality (death within 28 days)
- □ Early neonatal mortality (death within 7 days)
- □ Late neonatal mortality (death between 7 and 28 days)
- □ Postneonatal mortality (death between 28 days and 1 year)
- □ Infant mortality (death in the first year of life)
- \Box Child mortality

Please specify if the definition of outcome(s) used are different than described above: Click here to enter text.

Perinatal outcomes among live births:

- \Box Extremely low birth weight (birth weight <1000 g)
- \Box Very low birth weight (birth weight <1500 g)
- \Box Low birth weight (live birth with birth weight <2500 g)
- \Box Birth weight (continuous scale)
- \Box Small for gestational age (birth weight <10th centile for gestational age)
- \Box Very small for gestational age (birth weight $<3^{rd}$ centile for gestational age)
- □ Extremely preterm birth (gestational age <28 weeks)
- \Box Very preterm birth (gestational age <32 weeks)
- □ Gestational age (continuous scale)
- \Box Congenital anomalies

Please specify if the definition of outcome(s) used are different than described above: Click here to enter text.

Childhood outcomes:

- \Box Asthma
- □ Wheezing

□ Respiratory infections

- □ Upper respiratory infections
- □ Lower respiratory infections
- \Box Otitis media with effusion
- \Box Chronic cough

Extra information:

□ Changes in maternal (when pregnant) and/or child SHS exposure

□ Changes in maternal smoking during pregnancy

□ Changes in paternal smoking behaviour

□ Changes in child/adult smoking behaviour

Primary Outcomes:

[Outcome measure]				Page/Paragraph in article
	Total	Before intervention	After Intervention	
Population at risk (n)				
Events (n)				
Rates (%)				
	Unadjusted relative / absolute change (95% CI)	Adjusted relative / absolute change (95% CI)	Covariates adjusted for	Page/Paragraph in article
Association between intervention and outcome				

Secondary Outcomes:

* Area population statistics were obtained from the most recent possible estimates.

† See Appendix pp 32, 33 for details.

‡ Qualified: all workplaces/restaurants/bars smoke-free with two possible general exceptions: (1) workplaces/restaurants with a specified number of employees/seats or fewer; (2) smoking permitted in enclosed, separately ventilated smoking rooms.

§ Some coverage: some coverage for workplaces, restaurants, and bars, but less than that of the 100% smoke-free and qualified categories.

|| Different states passed different 100% smoke-free laws: workplaces, restaurants, and bars (eight states), restaurants and bars (two states), workplaces and restaurants (one state), and workplaces (one state).

¶ Day enforcement began, smoke-free law implemented December 2006

** Both smoke-free laws were accompanied by a tobacco tax increase and mass-media campaign.

†† Exceptions to this smoking smoke-free law were: hotels, bars and restaurants, sports, arts and culture venues, amusement arcades, tobacconist shops,

international passenger transport, private spaces, open air, and designated areas for smoking within each facility.

The smoking smoke-free law now included hospitality venues: hotels, bars and restaurants, sports, art and culture venues, amusement arcades, tobacconist shops, and international passenger transport. Designated smoking areas within each facility were still allowed.

§§ Congenital anomalies were defined as: cardiovascular/heart defects, musculoskeletal defects, missing/extra digits, limb reduction defects, clubfoot, craniosynostosis, facial defects, eye defects, orofacial clefts, gastrointestinal defects, gastroschizis, and atresia, and abdominal wall defects

III Including, but not limited to: restaurants, bars, bowling alleys, bingo halls, convenience stores, laundromats, and other business open to the public.

¶¶ Authorised smoking in establishments $< 80m^2$ and designated smoking areas in larger establishments.

*** Presumptive eligibility: low-income pregnant women are presumed to be eligible for Medicaid, so they can receive care (including smoking cessation services) while their Medicaid applications are still pending. The unborn-child option: the state can consider a fetus a "targeted low-income child", allowing coverage of prenatal care (including smoking cessation services) and delivery to low-income pregnant women, even if they cannot provide documentation of citizenship or residency.

Study (year)	SES Subgroup	Definition	Summary of findings
Protect peopl	e from tobacco sm	oke	
Amaral (2009) ²	Maternal education	Education categorised as: high school dropout, high school graduate, some college, and college or more	Workplace smoking restrictions both state-wide and local were not associated with changes in BW, LBW, VLBW and GA overall, however associations varied according to maternal education. Local smoking ordinances: Only mothers with a college education or more showed a decrease in VLBW following the introduction of local smoking legislation (-0.13% 95%CI -0.23 to -0.03). For BW and GA, no significant associations were found in any of the education categories. State-wide smoke-free legislation: A -9.25 grams decrease in BW (95%CI -14.87 to -3.63) was found in the sample of mothers who did not complete high school, and a -9.51 grams decrease in BW (95%CI -17.43 to -1.59) was found among mothers who completed college or more. In contrast, a 10.00 grams increase in BW (95%CI 2.83 to 17.17) was observed in the sample of mothers with a high school degree. Only mothers who did not complete high school showed a -0.04 week decrease in GA significant at p<0.1 (95%CI -0.08 to 0.00). Only mothers with a high school degree showed a significant -0.20% decrease in VLBW (95%CI -0.34 to -0.06).
Bakolis (2016) ³	Small area deprivation index	IMD quintiles (1: least deprived, 5: most deprived)	The introduction of smoke-free legislation was associated with an overall reduction in risk for LBW, VLBW, PTB, and SGA. Significant reductions observed across the four time windows (1, 2, 3, and 5 months) varied according to deprivation. Particularly the risk of VLBW among quintile 2 (ranging from OR 0.37 (95% CI: 0.15 to 0.88) to OR 0.65 (95% CI: 0.46 to 0.81)) and LBW among quintile 4 (ranging from OR 0.74 (95% CI: 0.59 to 0.92) to OR 0.88 (95% CI: 0.80 to 0.96)) was significantly reduced but not for the remaining birth outcomes or for quintiles 1, 3 and 5.
Been (2015) ⁶	Small area deprivation index	IMD quintiles (1: least deprived, 5: most deprived)	Smoke-free legislation was associated with a significant immediate and gradual reduction in RTIs in children overall. The immediate change in RTIs did not vary significantly according to SES. The gradual change in RTIs varied significantly according to SES: the greatest decrease in RTI admissions was observed among the most deprived children: -1.5% (95% CI: -2.1 to -1.0) per year. The association between area-level deprivation index and RTI admission rates was clearly demonstrated, with >30% of RTIs occurring in the most deprived quintile.
Hajdu (2017) ¹⁷	Maternal education	Education level categorised as: low education, high education. High education: high school or university/college graduates	Changes in outcomes were usually more beneficial among parents with low education (maternal education: GA, PTB, VPTB, BW, LBW, VLBW; paternal education: GA, PTB, BW, LBW). Among parents with high education, there were no significant changes in the outcomes.
Mackay (2010) ²⁴	Small area deprivation index	Scottish Index of Multiple Deprivation quintiles (1: affluent, 5: deprived)	Smoke-free public places and workplaces were associated with a gradual -19.5% decrease per year (-22.4 to -16.5) in paediatric emergency asthma admissions. The gradual reduction in hospital admissions for asthma among children did not vary significantly according to SES.
McKinnon (2015) ²⁷	Maternal education	Education in years (12 or less, 13–15, and 16 or more)	State-wide smoke-free legislation was associated with reductions in the risk of in PTB, LBW, SGA, BW and VPTB. These changes did not vary significantly according to SES.
Millet (2013) ²⁸	Small area deprivation index	IMD quintiles (1: least deprived, 5: most deprived)	The introduction of smoke-free legislation was associated with both an immediate and gradual reduction in child asthma hospital admissions for all levels of deprivation. These reductions did not vary significantly according to SES.
Simón (2017) ³³	Parental socio- economic position based on mother's and/or father's occupational status	NR	No significant differences in outcomes between different levels of parental socio-economic position.
Vicedo- Cabrera (2016) ³⁴	Economical position of the canton†	SES scores derived from a PCA, in tertiles (lower, intermediate, and higher)	Smoke-free legislation was not associated with a significant change in PTB. The change in risk of PTB did not vary significantly according to SES.
Raise taxes of	n tobacco		
Bhai (2015) ³⁶	Household poverty level	Low SES: households that are below 100% of the US federal poverty level. Middle SES: households that are	The largest reductions in asthma prevalence following increases in state cigarette excise tax were seen among low SES children: -3.2% per USD increase* (-4.8 to 1.6), as compared to middle SES ($-1.3\%*$ [-2.1 to -0.5], and high SES ($-1.2\%*$ [-1.8 to -0.6]).

Table S6: Variations in association between MPOWER policies and outcomes according to socioeconomic status

		between 100% and 300% of the poverty level. High SES: households that are above 300% of the poverty level.	
Hawkins (2014) ¹⁹	Maternal education	Education in years (12 or less, 13–15, and 16 or more)	Increased cigarette taxes were associated with a significant reduction in risk of several adverse birth outcomes. Mothers with the least amount of education had the strongest response to cigarette taxes with greater changes in BW, PTB, LBW, and SGA.

BW = Birth weight; GA = gestational age; IMD = Index of multiple deprivation; LBW = Low birth weight; PCA = Principal components analysis; PTB = Preterm birth; SES = socioeconomic status; SGA = Small for gestational age; VPTB = Very preterm birth.

*Percentage points

†The indicators related to the economical position of the canton were: foreign population, urban population, gross domestic product, educational level, population density, family size and status index.

Table S7: Association between implementation of tobacco control policies and secondary outcomes

MPOWER: Protect people from tobacco smoke (i.e. smoke-free legislation)									
First author (year)	Details of intervention	Population at risk	Total number of events (n (%)) / overall mean (SD)	Slope before intervention (% change in events per year)	Direct change in events (step change; % (95% CI) / mean difference (95% CI))	Sustained change in events per year (slope change; % (95% CI))	Summary of findings		
Stillbirth

* Both smoke-free laws were accompanied by a tobacco tax increase and mass-media campaign.

The smoke-free law now included hospitality venues: hotels, bars and restaurants, sports, art and culture venues, amusement arcades, tobacconist shops, and international passenger transport. Designated smoking areas within each facility were still allowed.

[†] Exceptions to this smoke-free law were: hotels, bars and restaurants, sports, arts and culture venues, amusement arcades, tobacconist shops, international passenger transport, private spaces, open air, and designated areas for smoking within each facility.

§ Percentage point change

The single smoke-free law model includes either the step or slope change of a single smoke-free law into the model.

||The final was obtained by including all three step changes and all three slope changes in one model and removing the least significant factors one at a time.

** Presumptive eligibility: low-income pregnant women are presumed to be eligible for Medicaid, so they can receive care (including smoking cessation services) while their Medicaid applications are still pending. The unborn-child option: the state can consider a foetus a "targeted low-income child", allowing coverage of prenatal care (including smoking cessation services) and delivery to low-income pregnant women, even if they cannot provide documentation of citizenship or residency.

†† The authors report these estimates as the lagged tax elasticities calculated from the GLS and OLS models respectively.

‡‡ Authorised smoking in establishments <80m2 and designated smoking areas in larger establishments.

Table S8: Association between tobacco control policies and smoking behaviour in included studies

Study	Definition of smoking behaviour	Data source	Effect estimates	Summary of findings
Maternal smoking before	e pregnancy			
Adams (2013) ¹	Self-reported maternal smoking before pregnancy, during pregnancy, and after delivery.	PRAMS	 Medicaid cessation coverage of: nicotine replacement therapy, medication, and counselling Group 1 – enrolled in Medicaid before pregnancy: -2·5%* (-5·2 to 0·2) Medicaid cessation coverage of: nicotine replacement therapy and medication, but no counselling Group 1 – enrolled in Medicaid before pregnancy: -1·6%* (-3·2 to -0·0) Some Medicaid cessation coverage of nicotine replacement therapy, medications, and counselling not already represented in categories 1 or 2 Group 1 – enrolled in Medicaid before pregnancy: -3·0%* (-5·0 to -1·0) 	Living in a state with Medicaid cessation coverage of nicotine replacement therapy and medication, but no counselling was associated with a -1.6 percentage point decrease in maternal smoking before pregnancy. Living in a state with some Medicaid cessation coverage of nicotine replacement therapy, medications, and counselling was associated with a -3.0 percentage point decrease in maternal smoking before pregnancy.
Maternal smoking during	g pregnancy			
Adams (2013) ¹	Self-reported maternal smoking before pregnancy, during pregnancy, and after delivery.	PRAMS	 Medicaid cessation coverage of: nicotine replacement therapy, medication, and counselling Group 2 – entered Medicaid during pregnancy: -0·4%* (-2·2 to 1·4) Group 3 – enrolled in Medicaid either before or during pregnancy: -0·7%* (-2·7 to 1·3) Medicaid cessation coverage of: nicotine replacement therapy and medication, but no counselling Group 2 – entered Medicaid during pregnancy: 0·6%* (-0·8 to 2·0) Group 3 – enrolled in Medicaid either before or during pregnancy: 0·6%* (-0·4 to 1·6) Some Medicaid cessation coverage of nicotine replacement therapy, medications, and counselling not already represented in categories 1 or 2 Group 2 – entered Medicaid during pregnancy: 1·7%* (-1·4 to 4·8) Group 3 – enrolled in Medicaid either before 	Expansion of Medicaid covered smoking cessation services were not associated with significant changes in maternal smoking during pregnancy.

			or during pregnancy: $1 \cdot 1\%^*$ (-0.9 to $3 \cdot 1$)	
Bartholomew (2016) ⁴	Self-reported maternal smoking status at time of delivery.	West Virginia Vital Statistics	Smoke-free legislation: Comprehensive: $-0.015\% * (-0.041 \text{ to} 0.011)$ Restrictive: $0.003\% * (-0.005 \text{ to} 0.011)$ Moderate: $0.004\% * (-0.002 \text{ to} 0.010)$ Limited: $0.001\% * (-0.006 \text{ to} 0.007)$	No significant association was seen between any of the smoke-free regulations (comprehensive, restrictive, moderate or limited) and maternal smoking during pregnancy.
Bharadwaj (2014) ⁸	Quit smoking during pregnancy, based on self- reported maternal smoking status at the start of pregnancy (GW 8-12) and at time of hospital delivery.	Medical Birth Registry of Norway	15.0%* (0.9 to 29.1)	After implementation of smoke-free restaurants and bars, there was a 15 percentage point increase in the proportion of mothers working in restaurants and bars who quit smoking during pregnancy as compared to mothers working in shops.
Evans (1999) ³⁷	Self-reported smoking and number of cigarettes smoked per day.	Natality Detail File	Maternal smoking Probit model: -0.085%* (-14.68) OLS model: -0.035%* (-7.36) Note: T-statistics in parenthesis Daily number of cigarettes Probit model: -0.0017 (-2.29) OLS model: -0.0045 (-1.63) Note: T-statistics in parenthesis	The authors report that their results suggest that maternal smoking participation during pregnancy and daily number of cigarettes decline when cigarette excise taxes are increased, but it is unclear whether these changes are statistically significant.
Hankins (2016) ¹⁸	Self-reported maternal smoking and number of cigarettes smoked per day.	National Center for Health Statistics; Centers for Disease Control and Prevention	Maternal smoking Workplaces: $-0.24\%^*$ (-0.67 to 0.19) Restaurants: $-0.08\%^*$ (-0.88 to 0.72) Bars: $-0.71\%^*$ (-1.57 to 0.15) Daily number of cigarettes Workplaces: $-11.43\%^*$ (-0.74 to 23.60) Restaurants: $-19.01\%^*$ (-36.6 to -1.41) Bars: $-6.00\%^*$ (-24.66 to 12.66)	There was no association between smoke-free legislation and smoking behaviour of pregnant women. Smoke-free restaurants were associated with a -19 percentage points reduction in the daily number of cigarettes smoked during pregnancy.
Hawkins (2014) ¹⁹	Self-reported maternal tobacco use during pregnancy.	US Natality Files; Public Health Statistics and	Smoke-free workplaces/restaurants: -0.91%* (-4.80, 2.98)	Smoke-free workplaces/restaurants were not associated with a significant change in maternal smoking during pregnancy.
		Information Systems	White mothers $0-11$ years of maternal education: -2.35% * $(-3.84 \text{ to} -0.86)$ 12 years of maternal education: -0.83% * ($-1.73 \text{ to} 0.07$)Black mothers $0-11$ years of maternal education: -2.09% * $(-3.40 \text{ to} -0.78)$ 12 years of maternal education: -0.90% * ($-1.39 \text{ to} -0.41$) $13-15$ years of maternal education: -0.70% * $(-1.03 \text{ to} -0.37)$ 16 + years of maternal education: -0.14% * (-1.14% * (-1.14% *)	Increase in cigarette tax was not associated with a reduction in maternal smoking during pregnancy for all ethnicity and education subgroups. Increased cigarette taxes were associated with a reduction in maternal smoking during pregnancy when examined according to race/ethnicity and education, with significant reduction in smoking during pregnancy observed for white mothers with a high school degree or less, and amongst black mothers across all education levels.

Jarlenski (2014) ⁴¹	Self-reported maternal	PRAMS	0.28 to -0.00) None of the other subgroups were associated with changes in smoking during pregnancy (Hispanic, Asian/Pacific Islander, and American Indian/Alaskan Native). Change in smoking cessation:	State's adoption of presumptive eligibility (A policy which permits women to receive
	smoking 3 months prior to conception and during pregnancy.		Either policy: 6.8%* (3.0 to 10.5) Presumptive eligibility: 7.7%* (3.7 to 11.6) Unborn-child option -2.1%* (-7.2 to 3.0)	prenatal care whilst their Medicaid application is pending) was associated with a 7.7 percentage points increase in the probability of smoking cessation. Adopting the unborn-child option (a policy which permits states to provide coverage to pregnant women who cannot document their citizenship or residency) did not significantly affect cessation of maternal smoking during pregnancy. Having either enrolment policy in place was associated with a 6.8 percentage-point increase in the probability of maternal smoking during pregnancy.
Kabir (2009) ⁴⁴	Maternal smokers classified as never, former or current.	Euroking K2 maternity system (Coombe University Maternal Hospital)	Change in current smokers: Pre-ban 23.4% (95% CI: 22.5% to 24.4%), Post-ban 20.6% (95% CI: 19.7% to 21.6%)	Significant 12% relative reduction in maternal smoking rates following workplace smoking ban.
Mackay (2012) ²⁵	Maternal smokers self- classified as current, never and former smokers.	Scottish Morbidity Record 02	Smoking prevalence pre-ban: 25.4%, Smoking prevalence post-ban: 18.8%	Following the introduction of smoke-free legislation, current smokers reduced from 25.4% to 18.8% (p<0.001) and there was an increase in never smoked from 57.3% to 58.4% (p<0.001).
Markowitz (2013) ²⁶	Self-reported maternal smoking during the last 3 months of pregnancy.	PRAMS	$\begin{array}{l} \mbox{Mothers who smoked during the last 3} \\ \mbox{months of pregnancy.} \\ \mbox{Restaurants: complete smoke-free law} \\ \mbox{Age } <20: 3 \cdot 40\% * (-0 \cdot 93 to 7 \cdot 72) \\ \mbox{Age } 20 to 24: -0 \cdot 40\% * (-2 \cdot 52 to 1 \cdot 72) \\ \mbox{Age } 25 to 34: -0 \cdot 40\% * (-1 \cdot 24 to 0 \cdot 44) \\ \mbox{Age } 35+: 3 \cdot 30\% * (-0 \cdot 42 to 7 \cdot 02)) \\ \mbox{Restaurants: smoking restrictions (requiring designated smoking areas) } \\ \mbox{Age } 20: 2 \cdot 30\% * (-1 \cdot 02 to 5 \cdot 61) \\ \mbox{Age } 20 to 24: 0 \cdot 30\% * (-1 \cdot 25 to 1 \cdot 85) \\ \mbox{Age } 20 to 24: 0 \cdot 30\% * (-0 \cdot 11 to 1 \cdot 31) \\ \mbox{Age } 35+: 2 \cdot 20\% * (-0 \cdot 46 to 4 \cdot 86) \\ \mbox{Tobacco tax increase } \\ \mbox{Age } 20: 0 \cdot 03\% * (-2 \cdot 91 to 2 \cdot 97) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 25 to 34: 0 \cdot 40\% * (-0 \cdot 51 to 1 \cdot 31) per \\ \mbox{USD increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mbox{increase in tax} \\ \mbox{Age } 35+: -0 \cdot 30\% * (-1 \cdot 30 to 0 \cdot 70) per USD \\ \mb$	There were no associations between smoke-free restaurants, smoking restrictions in restaurants, or tobacco tax increases and changes in the probability of smoking during the third trimester of pregnancy. A \$1 increase in cigarette price was associated with a decrease in the probabilities of teenagers smoking 21 or more cigarettes per day (1 percentage point), 11 to 20 cigarettes per day (2.6 percentage points) and six to 10 cigarettes per day (2.4 percentage points)
Page (2012) ²⁹	Self-reported maternal number of cigarettes smoked per day during lifetime, dichotomised as yes or no.	Colorado birth registry	Smoking prevalence pre-ban: 16.64% (I), 8 .66% (C); Smoking prevalence post-ban: 15.07% (I), 11.89% (C)	There was no significant change in smoking amongst mothers following the introduction of smoke-free legislation in the intervention area. The control area had a significant increase in number of smokers ($p<0.0001$) during the same time period.

Maternal smoking af	fter delivery			
Adams (2013) ¹	Self-reported maternal smoking before pregnancy, during pregnancy, and after delivery.	PRAMS	 Medicaid cessation coverage of: nicotine replacement therapy, medication, and counselling Group 2 – entered Medicaid during pregnancy: 0·8%* (-1·0 to 2·6) Group 3 – enrolled in Medicaid either before or during pregnancy: 0·5%* (-1·1 to 2·1) Medicaid cessation coverage of: nicotine replacement therapy and medication, but no counselling Group 2 – entered Medicaid during pregnancy: 0·3%* (-2·4 to 3·0) Group 3 – enrolled in Medicaid either before or during pregnancy: 0·2%* (-1·4 to 1·8) Some Medicaid cessation coverage of nicotine replacement therapy, medications, and counselling not already represented in categories 1 or 2 Group 2 – entered Medicaid during pregnancy: 1·6%* (-0.2 to 3.4) Group 3 – enrolled in Medicaid either before or during pregnancy: 1·4%* (-0·6 to 3·4) 	Expansion of Medicaid covered smoking cessation services was not associated with significant changes in maternal smoking after delivery.
Adult smoking behaviour				
Ma (2013) ³⁸	Current smoking prevalence of adults aged 18 to 39 years old and 40 years or older	Pennsylvania Health Care Cost Containment Council (PHC4) hospital discharge database	1st tax increase initial change: -0.52% (p = 0.73), 1st tax increase initial trend: 0.21% (p = 0.54); 2nd tax increase initial change: -1.75% (p = 0.14), 2nd tax increase initial trend: -0.46% (p = 0.18) Note: 95% confidence intervals could not be calculated for these changes.	There were no significant changes in smoking prevalence following either tax increase in all adults. When examined by age, the second tax increase in January 2004 was associated with an initial 5.2% decrease and an additional 1.4% quarterly decrease in smoking prevalence in 18 to 39 year olds.

* Percentage points; GW = Gestational week; PRAMS = Pregnancy Risk Assessment Monitoring System
