

Supplementary Figures

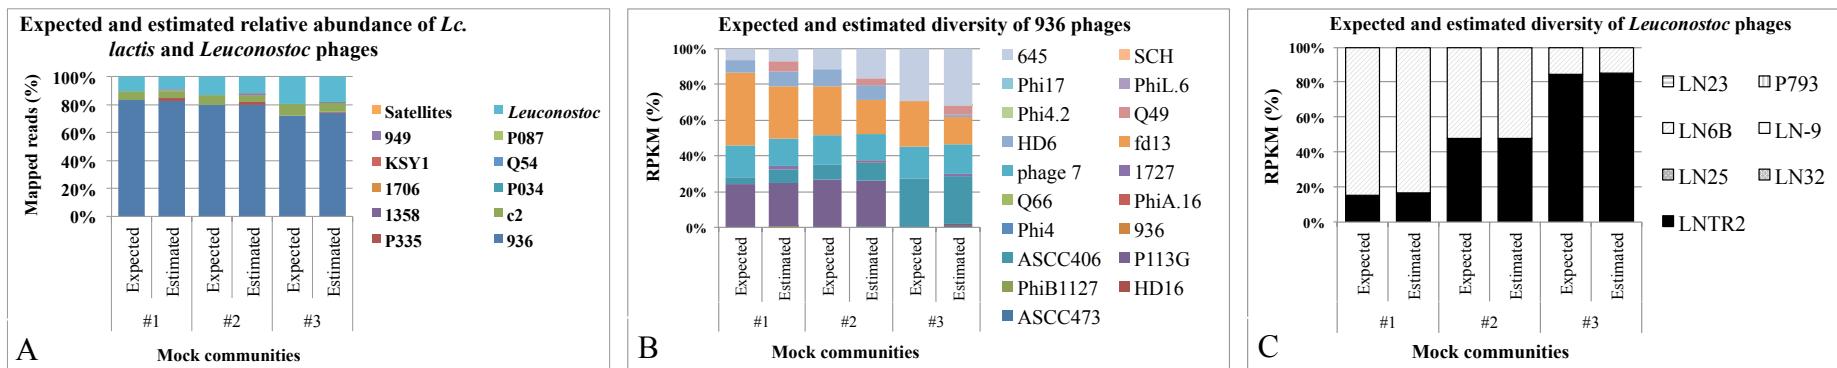

Fig. S1. Setting up of parameters for analysis of dairy metaviromes based on synthetic mock communities. The mock communities were intended to have a mixture of one million reads sampled from the genomes of *Lc. Lactis* and *Leuconostoc* phages. The actual or ‘Expected’ distribution of sequences is shown for comparison. (A) Relative abundance estimation of different *Lc. lactis* and *Leuconostoc* phages through mapping to corresponding reference genomes using 50% minimum query length and 80% minimum similarity thresholds. The result is expressed as the ‘Estimated’ percentage of mapped reads. (B) Estimation of the diversity of 936 phages through mapping to 936 phages receptor binding protein (RBP) sequences using 95% minimum query length and similarity thresholds. The result is expressed as reads per kilobase per million reads (RPKM) - the number of mapped reads normalized by the size of the subject RBP sequence. (C) Estimation of the diversity of *Leuconostoc* phages through mapping to *Leuconostoc* phages RBPs (the same threshold as for B).

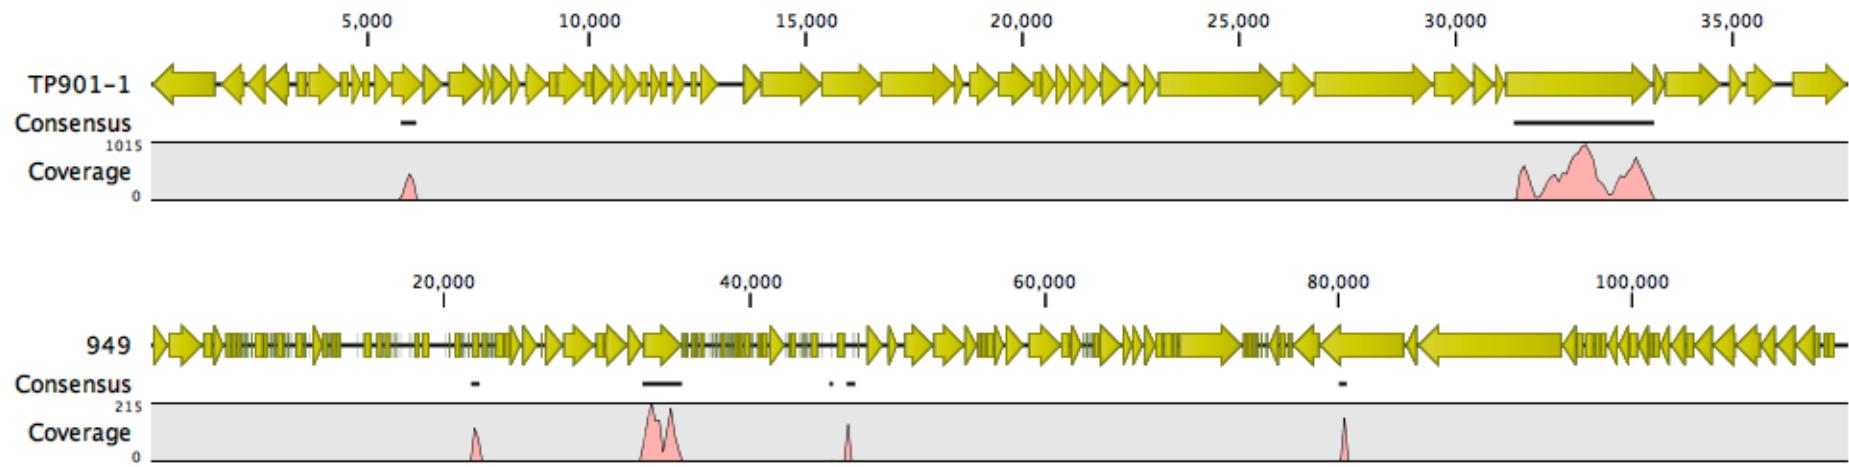

Fig. S2. Non-specific mapping of 936 phage sequences to TP901-1 and 949 genomes. A 50% minimum query length and 80% minimum identity thresholds were used for mapping mock communities to reference genomes. X- and Y-axis represent the reference genomes and the coverages, respectively. The regions with read coverage on the TP901-1 genome correspond to *orfI1* (left) and *nps* (right), and on the 949 genome to *gp047*, *gp062*, *gt004*, *gt005* (including the upstream intergenic space) and *gp128* (left to right, respectively).

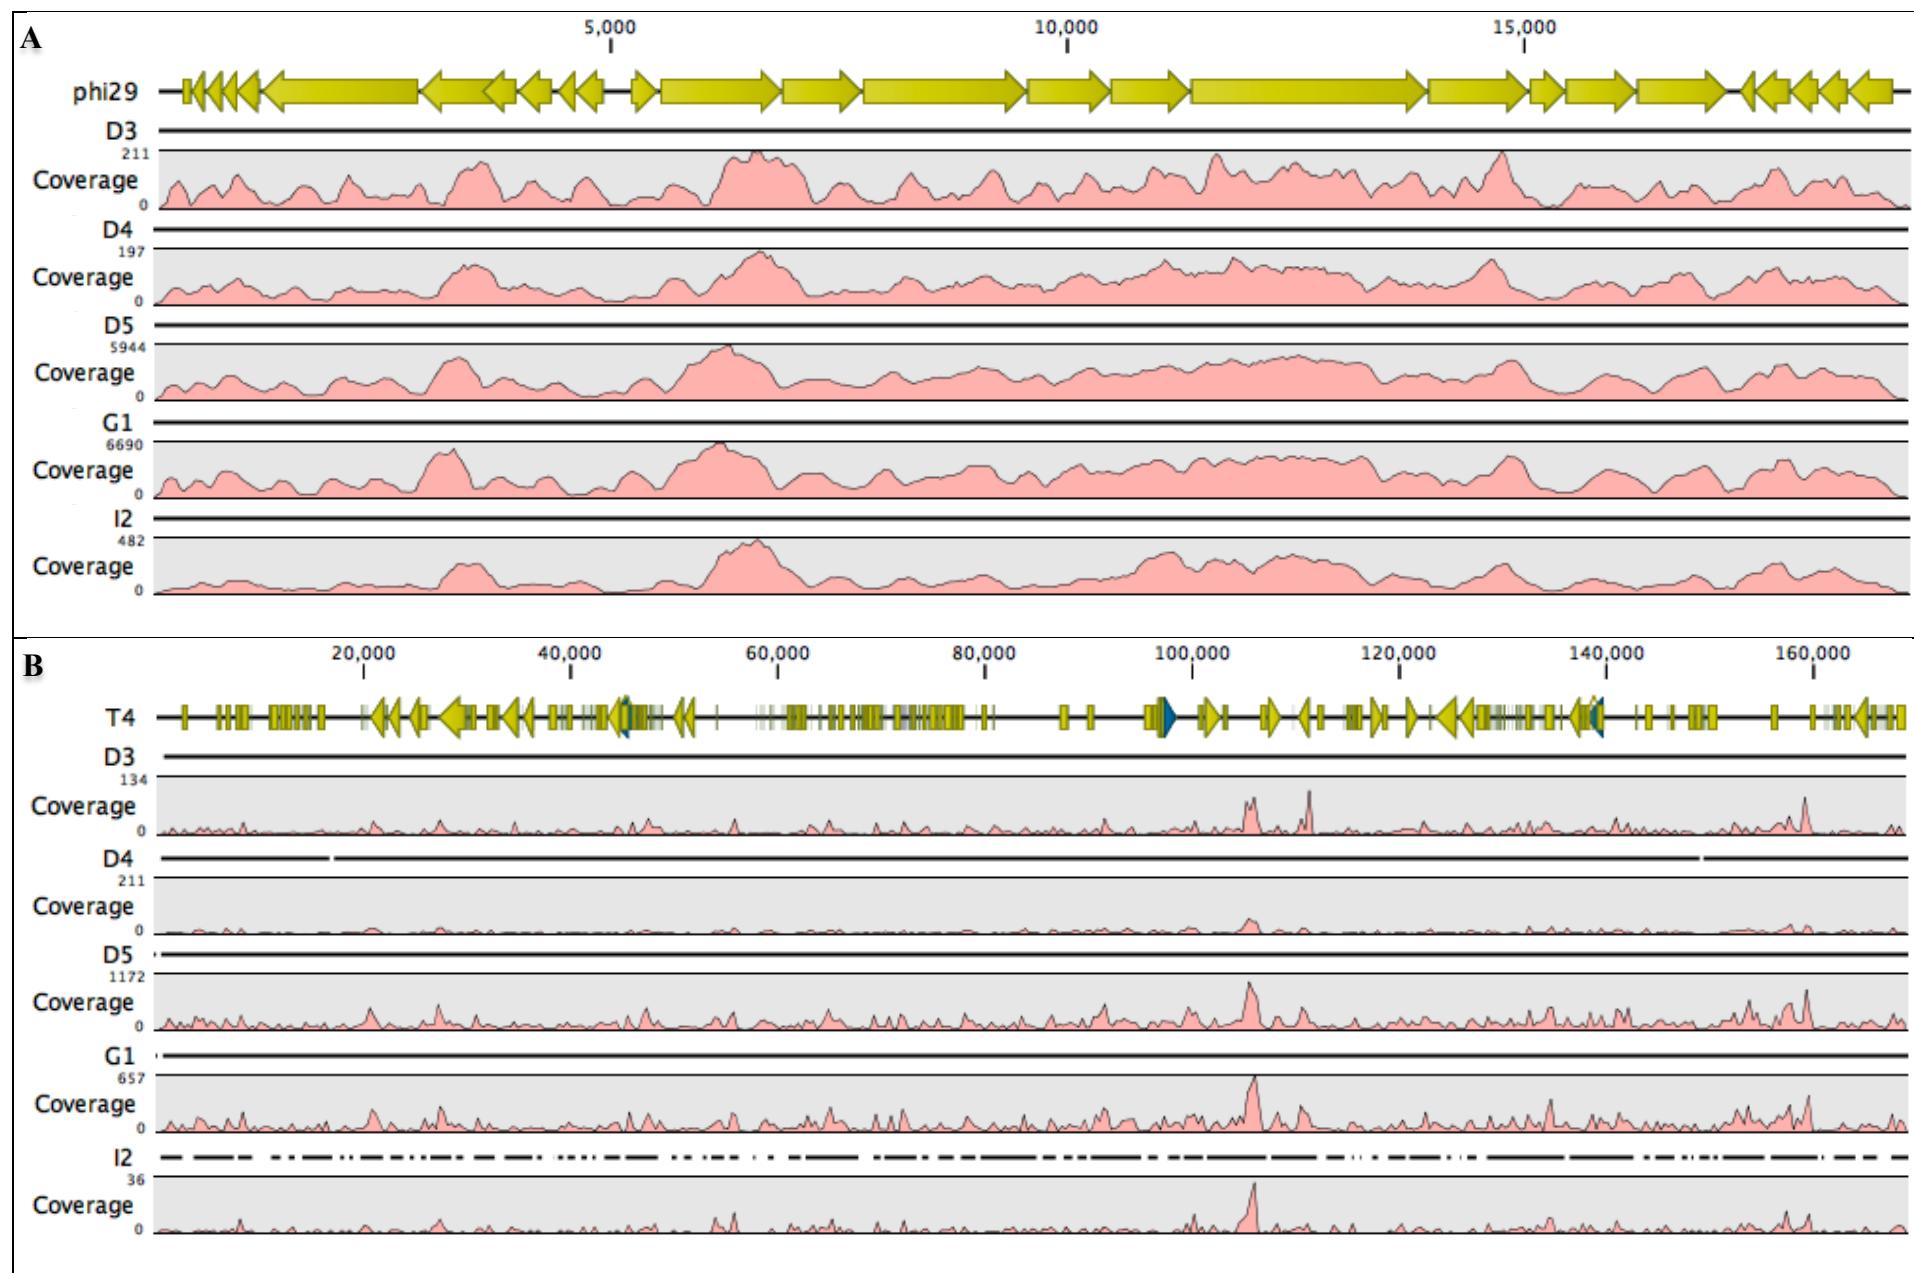

Fig. S3. Depth of coverage plots for the mapping of spiked phi29 (panel A) and T4 (panel B) sequences in mock communities. Coverage was assessed by mapping each metavirome dataset against phi29 and T4 reference genomes. X- and Y-axis represent the reference genome and coverage, respectively. Annotated genomes of phi29 and T4 phages are shown with nucleotide positions above the D3 mapping in the corresponding panels. The solid or broken lines above each coverage graph represent consensus sequences. Depth of coverage varies among the different samples, as indicated by the different scales on the Y-axis.

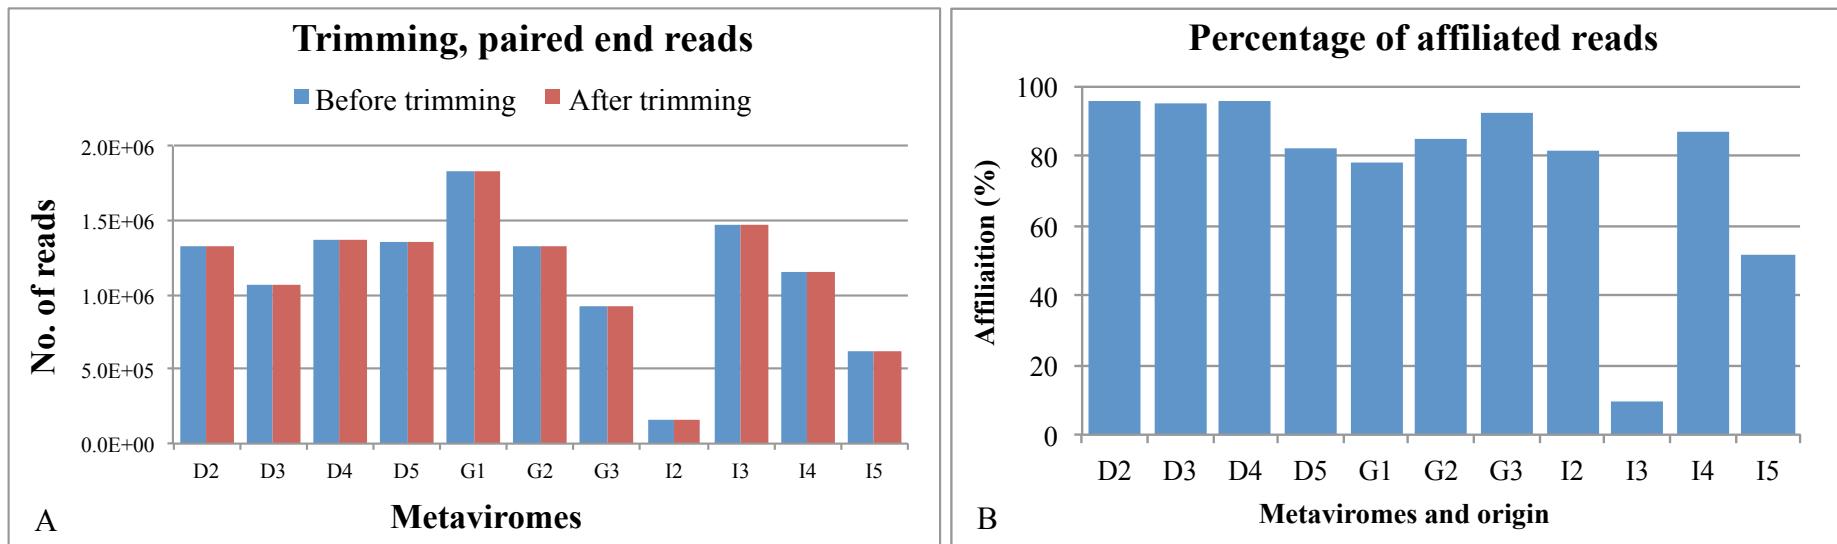

Fig. S4. (A) Metavirome sequence trimming prior to analysis. Trimming parameters were set to be as follows: trim Nextera XT adaptors, trim ambiguous nucleotides (limit = 2), trim low quality nucleotides (limit = 0.05), also search on reversed sequence, discard short reads after trimming (<15 nucleotides). (B) The fraction of metavirome sequences corresponding to dairy *Lc. lactis* and *Leuconostoc* phages. Analysis was run using the map-reads-to-reference function of CLC Genomics Workbench 8.5 (Qiagen, Denmark) using 50% minimum query length and 80% minimum identity thresholds, and using as references the genomes of dairy *Lc. lactis* and *Leuconostoc* phages available in GenBank until June 15 2016 and draft genomes obtained from in-house sources.

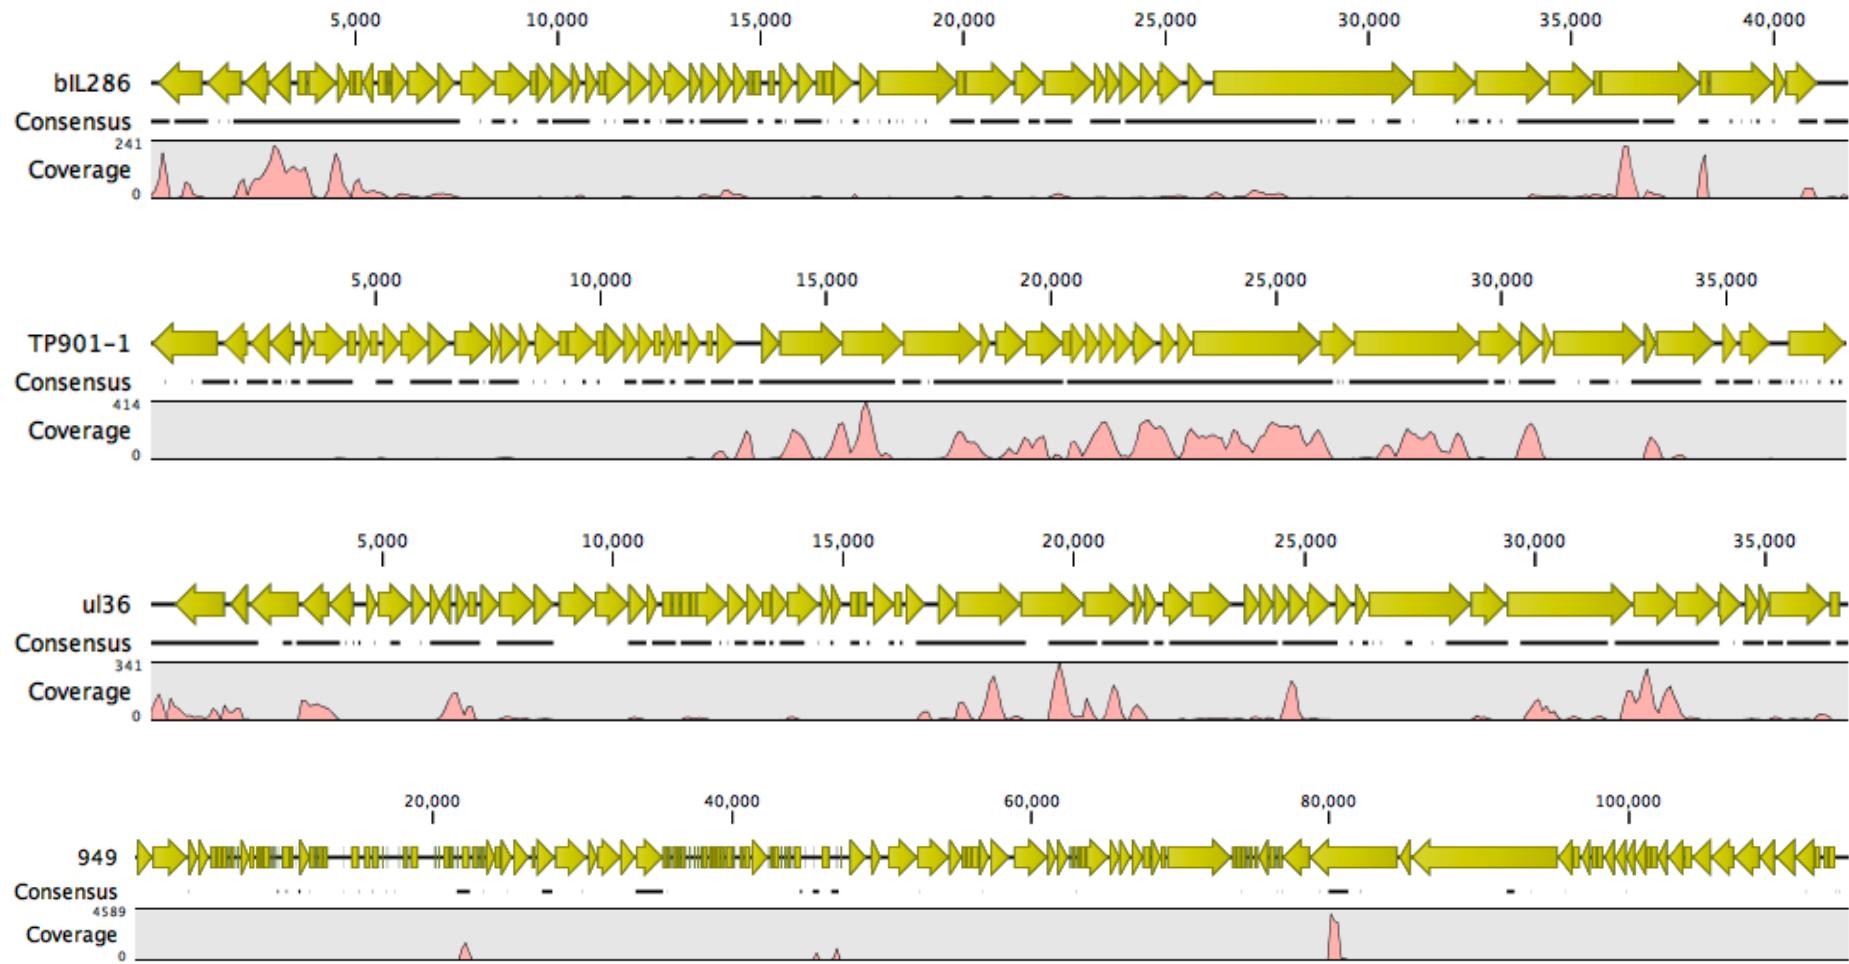

Fig. S5. Representative maps of TP901-1, bIL286, ul36 and 949 genomes with sequences of whey mixture metaviromes. X- and Y-axis represents the reference genome and coverage, respectively. The threshold for mapping in all cases was 50% minimum query length and 80% minimum identity. The regions with read coverage on the 949 genome correspond to *gp047*, *gp062*, *gt004*, *gp089-gt005* intergenic space, *gt005*, *gt006* and *gp128*.

Table S2. The impact of varying the amount of input reads on phage relative abundance estimation. Entries are scores representing the percentage of reads mapped to reference genomes and were obtained from statistics generated from mapping of reads to the genome sequences of *Lc. lactis* and *Leuconostoc* phages. The mapping threshold was set to a minimum of 50% query length and 80% identity.

Phage species	Amount of input reads (10^2 to 1.89×10^7), % mapped reads (entries)												
	10^2	5×10^2	10^3	10^4	5×10^4	10^5	2×10^5	5×10^5	10^6	2×10^6	5×10^6	10^7	1.89×10^7

HSP: high-scoring segment pairs, D: Denmark, G: Germany, I: Ireland, NA: Not available

Table S8. Diversity of 936 phages in whey mixture metavirome sequences. Reads per kilobase per million mapped reads (RPKM) values were derived from the number of reads that showed a minimum of 95% identity over 95% of the query length upon Ublast against 936 phages RBP sequences. Obtained numbers were normalized by the size of the subject RBP sequence, followed by the size of the metavirome.
