<sup>a</sup> IRR expressed per 30% decline in mGFR or eGFR calculated by modeling percent change in mGFR or eGFR below 0% (linear spline term with a knot at 0%); adjusted for age, sex, race, body mass index, systolic blood pressure, diabetes, total cholesterol, randomized treatment group, study group (for MDRD only), first measurement of proteinuria, and first measurement of mGFR or eGFR for the respective marker

<sup>b</sup> P-value from seemingly unrelated regression comparing IRR for the respective filtration marker vs. IRR for mGFR

<sup>c</sup> Average of 4 markers = (% Δ eGFR<sub>Cr</sub> + % Δ eGFR<sub>Cys</sub> + % Δ eGFR<sub>β2M</sub> + % Δ eGFR<sub>β2M</sub>)/4

AASK, African American Study of Kidney Disease and Hypertension; CI, confidence interval; eGFR, estimated glomerular filtration rate; ESRD, end-stage renal disease; IRR, incidence rate ratio; MDRD, Modification of Diet in Renal Disease; mGFR, measured glomerular filtration rate
