^a HR expressed per 30% decline in mGFR or eGFR calculated by modeling percent change in mGFR or eGFR below 0% (linear spline term with a knot at 0%); adjusted for age, sex, race, body mass index, systolic blood pressure, diabetes, total cholesterol, randomized treatment

group, study group (for MDRD only), and first measurement of mGFR or eGFR for the respective filtration marker

^b HR expressed per 30% increase in mGFR or eGFR calculated by modeling percent change in mGFR or eGFR above 0% (linear spline term with a knot at 0%); adjusted for age, sex, race, body mass index, systolic blood pressure, diabetes, total cholesterol, randomized treatment group, study group (for MDRD only), and first measurement of mGFR or eGFR for the respective filtration marker

^c Average of 4 markers = (% Δ eGFR_{Cr} + % Δ eGFR_{Cys} + % Δ eGFR_{βTP} + % Δ eGFR_{β2M})/4

AASK, African American Study of Kidney Disease and Hypertension; CI, confidence interval; eGFR, estimated glomerular filtration rate; ESRD, end-stage renal disease; HR, hazard ratio; MDRD, Modification of Diet in Renal Disease; mGFR, measured glomerular filtration rate
