

Supplementary Figure 1. CFE inhibits TPA-induced Migration in MCF-7 cells. (A) Cells were treated with various concentrations of CFE for each time. Cells were detected by EZ-cytox viability assay kit. (B) Cells were seeded in the upper chamber of chamber dishes and were either treated with CFE or untreated. After 24 hours, invasion cells were counted after staining. CFE = *crotonis fructus* extract; TPA = 12-O-tetradecanoylphorbol-13-acetate.
