

## **Fig S3. Nucleotide sequence alignments suggesting recombination in the past**

### **Table of contents**

#### **(A). Alignment suggesting recombination between MahEastAsia2 and undetected *Mycobacterium* lineage: the 53 kb region**

(i) Alignment for the *pntB* side of the 53.8-kb highly diverged region (4,758,973 to 4,812,752 in TH135 coordinate) in the MahEastAsia2 strains and three MahEastAsia1 strains is shown. The differentiated region in the three MahEastAsia1 strains, possibly imported from MahEastAsia2, are underlined. The border of the import in the tree MahEastAsia1 strains is unclear due to the absence of lineage-specific polymorphic sites around this region. (ii) Alignment for the MAH\_4513 side of the highly-diverged region.

#### **(B). Alignment of East Asia-type alleles in the *treS-maK* operon.**

(i) TreS. A nucleotide that differentiate East Asian alleles from *M. avium*-type alleles is indicated by blue or red background color. A nucleotide position that differentiate EA2-subtype from EA1-subtype were indicated by asterisk. Substitutions that affect product sequence are indicated by amino-acid sequence change below the alignment. The EA1-subtype contains a fragment possibly originating from *M. avium*-type allele. The possible import (216 bp) is underlined. Crossover regions are indicated by grey background. (ii) MalK. (iii) Membrane protein. Substitutions in the membrane-protein coding region does not affect product sequence.

#### **(C). Alignment suggesting recombination between MahEastAsia1 and SC2: the *treS-maK* operon**

The differentiated region containing the *treS-malK* operon in the genomes of MahEastAsia1. The 5,080 bp long diverged region was underlined. SNPs unique to the SC2 group are shown in green background, whereas SNPs unique to the MahEastAsia1 group is shown in red background. Alignment was generated using MAFFT software for 19,500 bp region spanning from MAV\_RS24815 (no original locus\_tag given) to MAV\_RS24905 (original locus\_tag: MAV\_5190). Alignment position on the sides indicate base position in the original alignment.

#### **(D). Alignment suggesting recombination between MahEastAsia1 and MahEastAsia2: the *treS-maK* operon**

An imported fragment containing the *treS-maK* operon in strain OCU404. SNPs derived from MahEastAsia1, and MahEastAsia1 were indicated by blue and red background colors, respectively. Possible crossover regions were indicated by grey background color. Alignment was generated using MAFFT software for 11,547 bp region spanning from *fbpC* to *sauT*. Alignment position on the sides indicate base position in the original alignment. Note that in strains 2344, OCU404, CAM57, DNA genomic regions around this region showed similarity to strains in MahEastAsia2, despite their overall chromosome similarity to strains in MahEastAsia1. Predicted length of the import in OCU404 (underlined) was 5,798 bp.

#### **(E). Alignment suggesting recombination between MahEastAsia1 and MahEastAsia2: MCE operon locus 3.**

(i) Left border of recent import predicted by fastGEAR. An alignment for 5,281 bp from *mmsB* to MAH\_0777-equivalent gene is shown. Crossover region is indicated by grey background. Imported region in OCU464 is underlined. (ii) Right border of recent import. An alignment for 1,159 bp from *pdc* (MAH\_0823) to MAH\_0824-equivalent gene is shown.

#### (A). Alignment suggesting recombination between MahEastAsia2 and undetected *Mycobacterium* lineage: the 53 kb region

(i) Alignment for the *pntB* side of the 53.8-kb highly diverged region (4,758,973 to 4,812,752 in TH135 coordinate) in the MahEastAsia2 strains and three MahEastAsia1 strains is shown. The differentiated region in the three MahEastAsia1 strains, possibly imported from MahEastAsia2, are underlined. The border of the import in the tree MahEastAsia1 strains is unclear due to the absence of lineage-specific polymorphic sites around this region. (ii) Alignment for the MAH\_4513 side of the highly diverged region.

### (B). Alignment of East Asia-type alleles in the *treS-maK* operon.

(i) TreS. A nucleotide that differentiate East Asian alleles from *M. avium*-type alleles is indicated by blue or red background color. A nucleotide position that differentiate EA2-subtype from EA1-subtype were indicated by asterisk. Substitutions that affect product sequence are indicated by amino-acid sequence change below the alignment. The EA1-subtype contains a fragment possibly originating from *M. avium*-type allele. The possible import (216 bp) is underlined. Crossover regions are indicated by grey background. (ii) MalK. (iii) Membrane protein. Substitutions in the membrane-protein coding region does not affect product sequence.

### (C). Alignment suggesting recombination between MahEastAsia1 and SC2: the *treS-maK* operon

The differentiated region containing the *treS-maK* operon in the genomes of MahEastAsia1. The 5,080 bp long diverged region was underlined. SNPs unique to the SC2 group are shown in green background, whereas SNPs unique to the MahEastAsia1 group is shown in red background. Alignment was generated using MAFFT software for 19,500 bp region spanning from MAV\_RS24815 (no original locus\_tag given) to MAV\_RS24905 (original locus\_tag: MAV\_5190). Alignment position on the sides indicate base position in the original alignment.

**(D). Alignment suggesting recombination between MahEastAsia1 and MahEastAsia2: the *treS-maK* operon**

An imported fragment containing the *treS-maK* operon in strain OCU404. SNPs derived from MahEastAsia1, and MahEastAsia1 were indicated by blue and red background colors, respectively. Possible crossover regions were indicated by grey background color. Alignment was generated using MAFFT software for 11,547 bp region spanning from *fbpC* to *sauT*. Alignment position on the sides indicate base position in the original alignment. Note that in strains 2344, OCU404, CAM57, DNA genomic regions around this region showed similarity to strains in MahEastAsia2, despite their overall chromosome similarity to strains in MahEastAsia1. Predicted length of the import in OCU404 (underlined) was 5,798 bp.

MAV\_0824 (->) SerGlnValArgMet

**(E). Alignment suggesting recombination between MahEastAsia1 and MahEastAsia2: MCE locus 3.**

**(i)** Left border of recent import predicted by fastGEAR. An alignment for 5,281 bp from *mmsB* to MAH\_0777-equivalent gene is shown. Crossover region is indicated by grey background. Imported region in OCU464 is underlined. **(ii)** Right border of recent import. An alignment for 1,159 bp from *pdc* (MAH\_0823) to MAH\_0824-equivalent gene is shown.
