

THE LANCET

Gastroenterology & Hepatology

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed.
We post it as supplied by the authors.

Supplement to: Elliott DRF, Walker AW, O'Donovan M, Parkhill J, Fitzgerald RC.
A non-endoscopic device to sample the oesophageal microbiota: a case-control study.
Lancet Gastroenterol Hepatol 2016; published online Nov 11. [http://dx.doi.org/10.1016/S2468-1253\(16\)30086-3](http://dx.doi.org/10.1016/S2468-1253(16)30086-3).

Web Appendix

Supplementary Text

Patients who underwent oesophagectomy received perioperative cefazoline, a cephalosporin antibiotic that is bactericidal and interferes with cell wall synthesis. Although the bacteria undergo cell lysis, which could lead to loss of nuclear material, the oesophageal tissue samples were taken immediately after the oesophagus was surgically resected and snap frozen in liquid nitrogen. We expect that this short time interval should minimise the opportunity for DNA to be washed away (notably the patient does not swallow saliva while they are paralysed for the procedure). In support of this, there were no significant differences in alpha diversity measures between tumour samples that underwent surgery and received preoperative antibiotics compared to tumour samples collected by endoscopic biopsy. Furthermore, after excluding the six OAC patients who took antibiotics from our diversity analysis, the trend was the same and showed decrease diversity in cancer samples compared to controls, as evidenced by the observed OTU richness ($p=0.0334$), the Chao estimate of total OTU richness ($p=0.0076$), but not the Shannon diversity index ($p=0.0821$).

Supplementary Figures and Tables

□

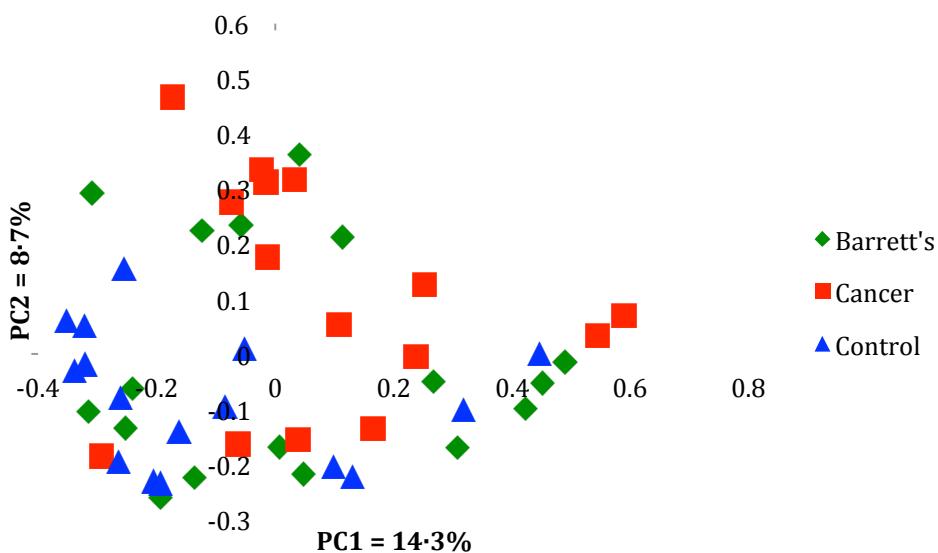

Figure S1. Principal coordinate analysis using the Bray-Curtis algorithm. The PCoA plot shows a significant separation between OAC and control samples ($p=0.001$). The first axis (PC1) accounts for 14.3% of the sample variance and the second axis (PC2) accounts for 8.7% of the variance.

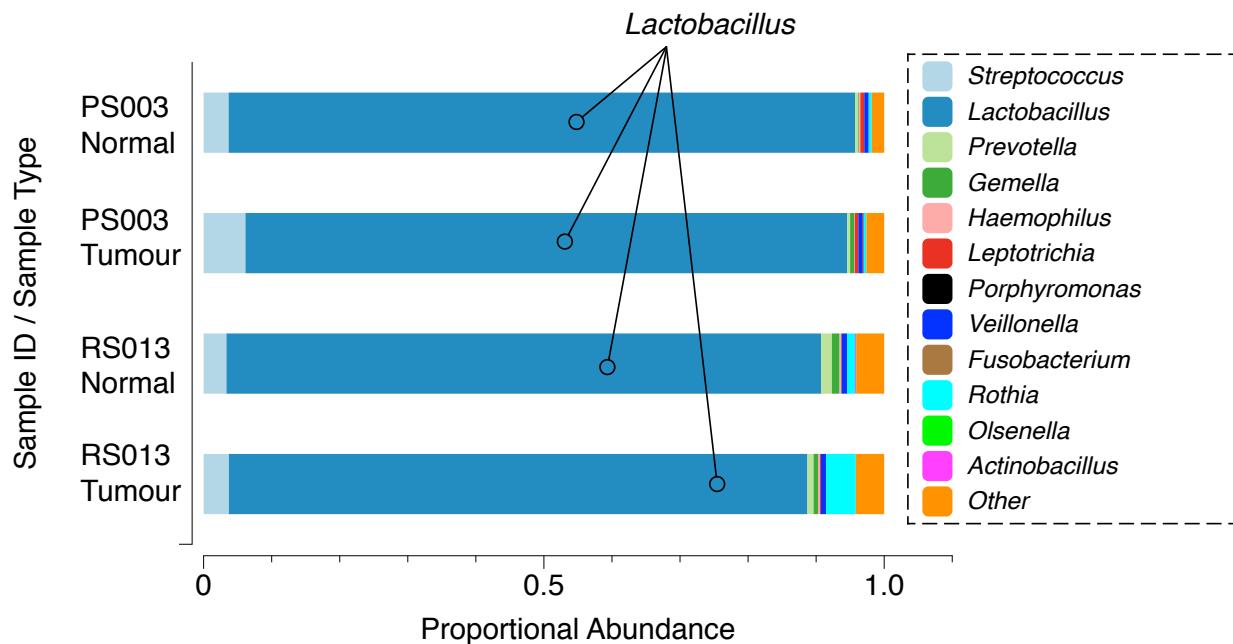

Figure S2. *Lactobacillus* is the dominant taxon in two tumour samples (PS003 and RS013) and matched normal squamous tissue.

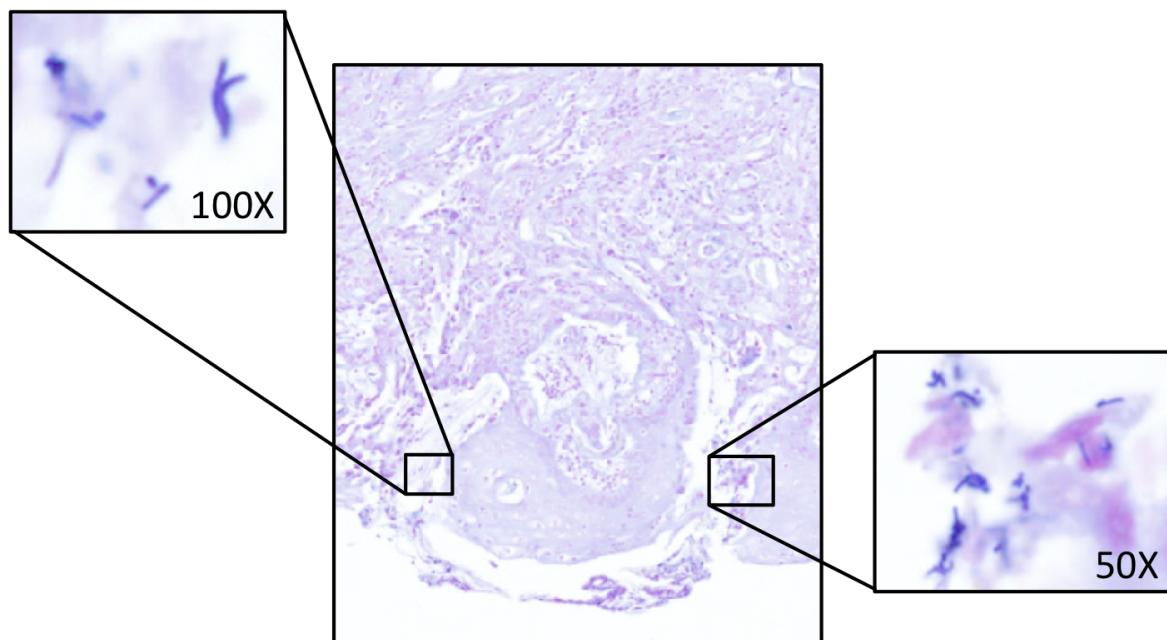

Figure S3. Tumour sample PS003 stained with haematoxylin and eosin, scanned at 20X magnification, imaged at 5% digital zoom. Insets show Gram stain with Gram-positive rods, imaged at 50% or 100% digital zoom.

Table S1. Clinicopathologic data for patients with oesophageal adenocarcinoma. Patient CTX or RCTX refers to chemotherapy or radio-chemotherapy received at any time during the patient's treatment course. All samples were untreated with chemotherapy (naïve). R1=margin involved, R0=margin clear, RX=information not available.

ID	Patient CTX	Patient Survival (mos)	Sample type	Tumour type	Stage	Pathological TNM	Differentiation
