The first column denotes two categories including biological processes and molecular functions. The second column denotes the pathways and larger processes in biological processes and molecular functions (GO term). The header of the third column shows the entire background genes number, that is 20814 in GO database, and other values in the third column show the number of human genes (all genes in database) enriched in each GO term. The header of the fourth column shows that 22 target genes match the GO database and are used for the enrichment analysis, and the other number in the fourth column denotes the number of target genes enriched in each GO term. The fifth column shows the expected sizes for each GO term which is calculated according to the real number of enriched target genes for each GO term and the ratio of the number of human genes enriched in each GO term and all human genes in GO database. The sixth column shows the fold changes calculated as the ratio between the observed number of target genes in each GO term and the expected size from the fifth column. The seventh column shows the p-values calculated from the probability or chance of seeing the number of target genes out of the total genes in the list annotated to a particular GO term. The eighth column shows the $-\log(p\text{-value})$.
