

Supplementary Information for the manuscript:

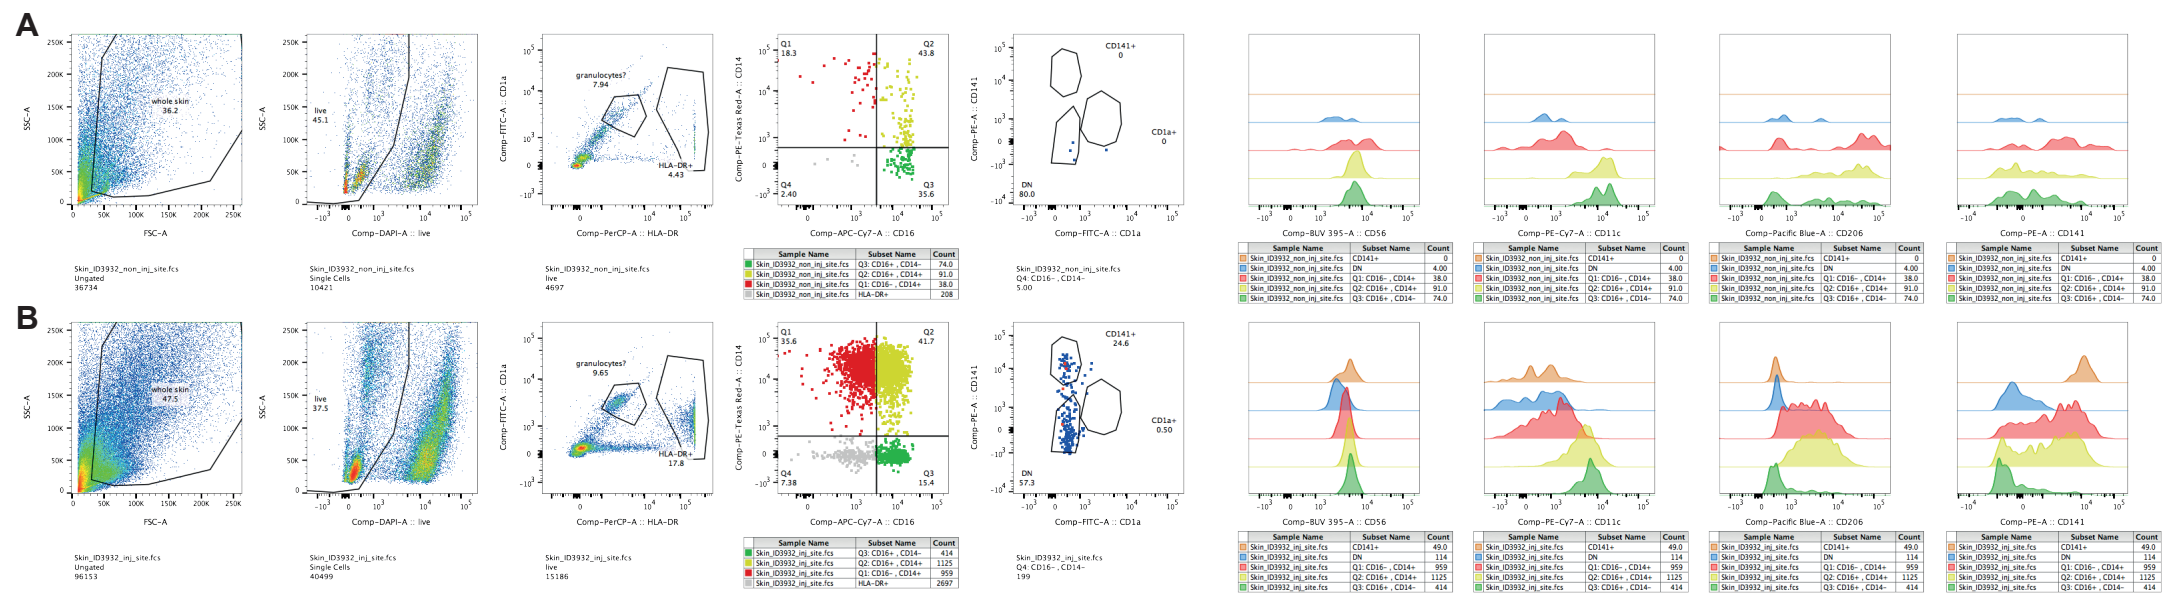

Skin dendritic cell and T cell activation associated with dengue shock syndrome

Huynh Thi Le Duyen¹, Daniela Cerny^{2,3}, Dinh The Trung¹, Jassia Pang⁴, Sumathy Velumani², Ying Xiu Toh², Phan Tu Qui⁵, Nguyen Van Hao^{5,6}, Cameron Simmons^{1,7}, Muzlifah Haniffa⁸, Bridget Wills^{1,9*}, Katja Fink^{2,3*}

Supplementary Figure 1:

No consistent accumulation of CD14^{dim}CD16⁺ cells in the skin of DSS patients. Skin biopsies from DSS patients and healthy controls stained for endothelial cell marker CD31 (red) and monocyte marker CD16 (green). CD16⁺ cells were observed for patient . Numbers on the left of the image series indicate the length/heights of the square pictures. HC: healthy control, DSS: Dengue shock syndrome

Supplementary Figure 2: Gating strategy for CM skin cells and expression levels of CD56, CD11c, CD206 and CD14 on monocyte and dendritic cell subsets. A) Skin cells from the untreated control site. B) Skin cells from the injection site. Skin biopsies were collected four days after infection.
