

A)

Supplemental Figure 1: MMP-14 upregulation and non-fibrillar TTR deposition in a naïve mouse model. **A)** Representative images obtained with IHC for MMP-14 using Hsf/V30M mouse model with 3, 6 and 22 months of age (n=6), showing an increase of MMP-14 expression in animals with 22 months. Chart represents quantification of immunohistochemical images (scale bar 100µm) and data was analyzed using one-way ANOVA followed by Bonferroni post-test and represented as mean± SEM (***p* <0.001).
