

Supplementary Figure S5: Effect of IPP on growth of PfATG18 depleted parasites.

PfATG18-3HA-DD parasites grown in the presence or absence of Shld-1 as described in main text. In addition, in one set of Shld-1 (-) parasites 200 μ M IPP was added. Parasite growth was measured using a SYBR-green based assay after 144h. % inhibition in growth of Shld-1 deprived parasites in comparison to Shld-1 treated parasites (100%) is represented [SEM \pm SE, n=3 (t-test, *, p<0.05)].
