

# THE LANCET Infectious Diseases

## Supplementary webappendix

This webappendix formed part of the original submission and has been peer reviewed.  
We post it as supplied by the authors.

Supplement to: Shearer FM, Moyes CL, Pigott DM, et al. Global yellow fever vaccination coverage from 1970 to 2016: an adjusted retrospective analysis. *Lancet Infect Dis* 2017; published online August 16. [http://dx.doi.org/10.1016/S1473-3099\(17\)30419-X](http://dx.doi.org/10.1016/S1473-3099(17)30419-X).

### **Methods appendix**

#### **Data collation and extraction**

##### **Routine childhood vaccination data**

Data on routine infant vaccination coverage were obtained from annual national estimates, based on health-service-provider registries of yellow fever (YF) coverage reported yearly by each at-risk country to the World Health Organization (WHO) and United Nations International Children's Emergency Fund (UNICEF) using the joint reporting form (JRF) on immunisation.<sup>1</sup> The data were available from the year of YF vaccine introduction into the country's routine immunisation schedule up to 2015. Province or state level data, as estimated by the WHO/UNICEF<sup>2</sup> based on data reported in the JRF, were also available for certain countries with localised areas of YF risk, namely, Panama, Argentina, and Kenya.<sup>3</sup> The WHO/UNICEF estimates for Brazil indicated that vaccines were only administered to infants in risk zones and we assumed these estimates only applied to municipalities within areas classified as ‘endemic’ by WHO range maps.<sup>4</sup> Since we used other data types reporting up to 2016, to obtain estimates of all routine coverage for 2016, we assumed that coverage was the same as for 2015.

##### **Preventive and outbreak response vaccination campaign data**

Data on mass preventive and outbreak response campaigns were primarily extracted from published online sources including the Weekly Epidemiological Records (WERS), Disease Outbreak News (DONs), Morbidity

and Mortality Weekly Reports (MMWRs), and two WHO reports: one on mass vaccination in West and Central Africa through the 1940s to 1960s,<sup>5</sup> and another on the 2016 epidemic in the Democratic Republic of Congo<sup>6</sup>. For the WERs, DONs, and MMWRs, we searched all reports within the specified date range (see manuscript Table 1) for the keywords “yellow fever”, of which we downloaded those containing information on YF vaccination activities. The detail in these reports varied greatly from campaign to campaign and was reported at a variety of spatial scales. If vaccination coverage for a campaign was not given, it was estimated using other information, such as the number of vaccine doses administered, combined with population estimates (see ‘Processing demographic data’, below). The following information was recorded for each vaccination campaign, where available: campaign time period, target location(s), target age range, number of vaccine doses (either administered or supplied), target population size, proportion of target population vaccinated (coverage), and whether coverage was estimated from a post-campaign survey or administrative data (ie, health-service-provider reported estimates).

Where available, coverage values were derived from post-campaign coverage surveys that asked participants whether they could recall having ever received a YF vaccine (and/or their children) and whether they could present an official YF vaccination record. Post-campaign coverage surveys were used in preference of administrative data because these generally provide more reliable coverage estimates.<sup>7</sup> Finally, duplicate data were removed for campaign records covering the same location and time period, retaining the most precise records. A description of the data issues encountered and actions taken is included in Supplementary table 1 and a summary of the information extracted from the WERs, DONs, MMWRs and WHO reports can be found in Supplementary table 2.

**Supplementary table 1:** Extraction issues with preventive and outbreak response vaccination campaign data and actions taken.

Data issue	Action taken
Campaign described as “planned” or “in progress” at the time of the report but the number of vaccine doses to be administered was specified	Assumed that one dose was administered per person in targeted locations
Campaign described as “planned” and only the target population size was specified	Campaign was excluded
Target age group was described as “children”	Assumed that this referred to children less than five years of age
Target age groups not specified	Assumed that individuals in all age groups had an equal chance of receiving a vaccine dose
Coverage was reported to be greater than 100%	Coverage resolved to 100%
Coverage range was stated (eg, 90–95%)	Recorded lower limit (eg, 90%)
The report quoted the number of people vaccinated rather than number of doses or coverage	Recorded as the number of vaccine doses
Coverage was not directly reported (ie, only the number of vaccine doses administered, number of people vaccinated or target population size etc. was provided)	Estimated coverage by calculating the size of target population (denominator) using WorldPop and UN WPP data
Coverage reported without specifying the size of the target population	Assumed that target population size equalled population of target locations
Target population size reported without specifying the coverage value	Coverage was assumed to be 100%
The number of vaccines doses, the number of people vaccinated or the size of the target population was reported to be greater than the total estimated number of people in the specified target locations	Target population size was replaced with estimated population size of target locations, meaning that coverage was 100%
The number of vaccine doses was provided without reporting the achieved coverage or the target population size	Assumed that number of people vaccinated equalled number of vaccine doses
Target population size not reported	Assumed target population size equalled population of target

	locations
Coverage or number of vaccine doses was aggregated over a number of target locations	Assumed that individuals in each location had an equal chance of receiving a vaccine dose
Unclear whether the campaign was targeting locations at the third or fourth order administrative unit (ie, locations have the same name and it was not clear which was targeted in the report)	Assumed campaign targeted the third order administrative unit
Target locations provided at the third or fourth order administrative level	Coverage at the second administrative level was calculated
Target locations not specified	Divided number of people vaccinated by estimated population size within broad target locations or within the entire country
Target locations listed as “endemic” or “at risk” regions	Divided number of people vaccinated by estimated population size within districts classified as endemic or at-risk by the WHO <sup>4</sup>
Number of vaccine doses aggregated over multiple years	Assumed that an equal number of doses were administered each year
Different coverage values reported from a post-campaign survey based on 1) combination of respondent recall and the presence of official vaccination records and 2) vaccination records only	Used coverage value based on combination of respondent recall and presence of official vaccination records

**Supplementary table 2:** Preventive and outbreak response campaigns reported in each Weekly Epidemiological Report (WER)<sup>8</sup>, Disease Outbreak News (DON)<sup>9</sup>, Morbidity and Mortality Weekly Report (MMWR), and two World Health Organization reports: one on mass immunization in West and Central Africa in the 1940s and 1950s<sup>5</sup> and another on the 2016 YF epidemic in the Democratic Republic of Congo<sup>6</sup>. The DONs are identified by the date of issue in the format ddmmyy and the WERs by four digits representing the volume and issue numbers.

### Processing supplementary data for Brazil

The Brazilian national immunization program information system provided more detailed data for Brazil that contained the number of vaccine doses administered in each second administrative level (municipality) in one-year age bands (from zero to four years), five-year age bands (five to 14 years) and broader age groups, 15 to 59 years and 60 plus years annually from 2006 to 2015. We assumed that this data captured all doses administered to the Brazilian population between 2006 and 2015 and thus routine and mass preventive and outbreak campaign data from other sources during this period were excluded from coverage calculations. The WHO/UNICEF estimates for Brazil reported routine coverage of infants in YF at-risk areas from 1998 onwards.<sup>3</sup> We included the WHO/UNICEF estimates from 1998 to 2005.

To assess the difference between YF vaccination coverage estimates for Brazil when using these two different data sources for the years from 2006 to 2015, we produced two sets of coverage maps (Supplementary figure 1) and two sets of estimates of the number of individuals requiring vaccination (Supplementary table 3).

**Supplementary table 3:** Estimated number of individuals (in millions) that still need to be vaccinated against yellow fever in 2016 in order to achieve the population coverage threshold of 80% recommended by the WHO

to prevent outbreaks in every municipality of Brazil. Estimates were calculated using vaccination data either from the Brazilian NIP or from a range of sources listed in manuscript Table 1.

	At-risk municipalities only			All municipalities		
	Conservative	Untargeted	Optimistic	Conservative	Untargeted	Optimistic
Brazilian NIP data	40.3	6.8	2.1	121.8	49.7	27.1
Data sources from Table 1	40.0	2.0	0	122.3	26.3	0

**Supplementary figure 1:** Estimated proportion of the population in 2016 across all age cohorts who have ever received a yellow fever (YF) vaccine at municipality level in Brazil. Vaccination coverage was calculated using the three alternative vaccination-targeting scenarios; targeted (A & D), untargeted, unbiased (B & E), and untargeted, biased (C & F). The panels also display estimates calculated using vaccination data either from the Brazilian NIP (A-C) or from a range of sources listed in manuscript table 1 (D-F).

#### Processing demographic data

Annual age-structured population counts for each district were required to calculate population vaccination coverage and to estimate denominators for preventive and outbreak response vaccination campaigns where coverage values could not be directly extracted from the data source. Estimates of these population counts were derived from a combination of United Nations World Population Prospects (UNWPP) (<https://esa.un.org/unpd/wpp/>),<sup>10</sup> WorldPop Project (<http://www.worldpop.org.uk/>)<sup>11</sup> and Gridded Population of the World (GPW) (<http://sedac.ciesin.columbia.edu/data/collection/gpw-v4>)<sup>12</sup> data. The latter two data sets were mosaicked together, with WorldPop data used in preference where they overlapped, to produce a fine scale human population density data surface for 2015 for each 1 km × 1 km grid square.

The UNWPP<sup>10</sup> estimates of the population size by country in five-year age bands for each year between 1950 and 2015 were disaggregated into annual birth cohorts using the methods described by Garske and colleagues<sup>13</sup>. This method required UNWPP data on infant and child mortality rates. To achieve higher spatial resolution of population distribution, these estimates were combined with the fine scale human population density data for 2015. By allocating each 1 km × 1 km grid square (or portion thereof) to a district, the proportion of each

country's population living in any particular district was estimated. It was assumed that age distributions and population growth were homogeneous within each country, and that the population proportions for each district obtained from WorldPop and GPW were applicable for all other years eg, trends in urbanisation were not captured. To estimate the population in each district for 2016, we assumed the same growth rate as the previous year.

### **Vaccination probability and coverage estimates**

We tracked each age cohort (from ages zero to 99) in every district through time – from their birth year through to 2016 (ie, the earliest cohort was born in 1871 in order to track coverage of individuals aged 99 in 1970) – updating the coverage level whenever a routine, preventive or outbreak response campaign was conducted. The equations below show how the proportion vaccinated, P, for each age cohort, was calculated under each of the three vaccination-targeting scenarios, given any new vaccination activity, V.

*Untargeted, unbiased:* assuming vaccination history was not taken into account and all individuals had an equal chance of receiving a vaccine regardless of their previous vaccination status.

$$P = P_{(\text{proportion of cohort previously vaccinated})} + P_{(\text{proportion of cohort vaccinated in } V)} - P_{(\text{proportion of cohort previously vaccinated})} \times P_{(\text{proportion of cohort vaccinated in } V)}$$

*Targeted:* assuming that vaccination history was taken into account and only non-vaccinated individuals were targeted by immunisation campaigns.

$$P = P_{(\text{proportion of cohort previously vaccinated})} + P_{(\text{proportion of cohort vaccinated in } V)}$$

*Untargeted, biased:* assuming that vaccination history was not taken into account and that previously vaccinated individuals were more likely to be targeted inadvertently.

$$P = \text{maximum} (P_{(\text{proportion of cohort previously vaccinated})}, P_{(\text{proportion of cohort vaccinated in } V)})$$

To estimate population-wide vaccination under each scenario, we calculated the weighted mean proportion vaccinated across all age cohorts, weighted by population size.

## Results appendix

**Supplementary figures 2-5:** Estimated proportion of individuals within each age group that have ever received a YF vaccine (vaccination coverage) for each country at risk of YFV transmission, based on the *untargeted, unbiased* vaccination-targeting scenario. Separate plots are shown for the beginning of each decade from 1970 to 2010.

**Supplementary table 4:** Vaccination coverage estimates and the estimated number of individuals that still need to be vaccinated against YF in 2016 in every district of all countries at risk of YF virus transmission (ie, classified as ‘endemic’, ‘transitional’ or ‘low potential risk of exposure’ by the WHO range maps) to achieve the 80% population coverage threshold recommended by the WHO to prevent outbreaks. An excel version of this data is also available in Dryad Digital Repository [link to be inserted upon manuscript acceptance].

Country ID	Country name	GAUL code	District name	Vaccination coverage 2016			Individuals requiring vaccination to meet 80% target

**Supplementary table 5:** Bias correction terms for each country and year calculated as the ratio of survey-derived Global Burden of Disease Study estimates of mean coverage of third dose diphtheria-tetanus-pertussis-containing vaccine (DTP3) and WHO/UNICEF Joint Reporting Form administratively reported estimates. An excel version of this data is also available on Dryad Digital Repository [link to be inserted upon manuscript acceptance].

Country code	Year	GBD mean estimate	Administrative estimate	Bias correction term
