

SUPPLEMENTAL MATERIAL

SUPPLEMENTAL METHODS:

Fly stocks: To study long-term effects of hypoxia, we used three *Drosophila* populations, selected over more than 250 generations for survival at 4% O₂ ('hypoxia selected,' HS), a level that is normally developmentally lethal. Three distinct and genetically isolated populations, maintained in parallel with HS flies but under normoxia for over 250 generations, were used as the appropriate outbred, unselected control populations for HS ('normoxia controls', NC; see ^{1,2}). 3-week-old, male HS and NC flies were used for cardiac function studies. 3-week-old, female *w*¹¹¹⁸ flies were used as the appropriate wildtype background for cardiac function assessments in response to genetic manipulations and chronic hypoxia exposure (CH). Within genotypes, there were no differences observed in baseline heart parameters between male and female flies, except in diameters (see also ³).

Specific knockdown of genes was achieved using the Gal4 system, which allows tissue-specific expression of Gal4 and induction or knockout of genes by binding an upstream activation sequence (UAS) of the gene of interest ^{4,5}. We used two cardiac-specific drivers, TinCΔ4-Gal4, Hand4.2-Gal4 and SNS-Gal4, to modulate gene expression in myocardial cells only ('TinC'), myocardial and pericardial cells ('Hand4.2') or in pericardial cells ('SNS') ^{17,50}. See also Figure 4A for illustration of cellular arrangements.

UAS-RNAi lines were used for knockdown gene expression: v109858 ('CanA14F-RNAi KK') and v103144 ('PP2B-RNAi KK') from the Vienna *Drosophila* Resource Center (<http://stockcenter.vdrc.at/control/main>). v60100 (*y,w[1118];P{attP,y[+],w[3]}*, 'KK control') were crossed to Gal4 drivers as appropriate UAS-RNAi control lines, and used for the control comparisons within each experiment. #22025 ('UAS-Pp2B') was obtained from Bloomington

qPCR validation of cardiac gene expression: Total RNAi was isolated from 15 fly hearts per sample in quadruplicate with a Qiagen RNeasy Isolation kit as per manufacturer's protocol. Total RNA (15-30 ng) was quantified and checked for purity using a Nanodrop® spectrophotometry. RNA was subsequently reverse-transcribed using a QuantiTect® Reverse Transcription Kit as per manufacturer's protocol. Primers were designed using Perl Primer® software and provided by IDT®. Annealing temperature of the primers was optimized and primer efficiency determined. The qPCR experiments were carried out using the Roche® FastStart Essential DNA Green Master ® kit with a Roche® LightCycler® 96. Housing keeping gene RPL-32 was used as a control. Primer sequences:

CanA14f: F-GCTGATCACCATCTTCTCGG R-GCACGTTACCAACATCTC.

Pp2B-14D: F-GCTGATCACCATCTTCTCGG R-GCACGTTACCAACATCTC.

CanB: F-CAAGCTGGATCTGGACAACT R-CACCATCATCTTGAGCACCT.

CanB2: F-GTGTTCOAATTTGACGCC R-TGTAACCATCGTTGTCCATGT.

Heart function analysis experiments: Semi-intact hearts were dissected and equilibrated under normoxia conditions as previously described ^{3,6}. Exposed hearts were perfused with artificial hemolymph bubbled with room air and filmed under 21% O₂. Dissolved O₂ content was monitored and recorded using a Qubit Systems OX1LP polarographic oxygen probe, calibrated and corrected for mean barometric pressure (758 mm Hg), salinity (8.2‰) and perfusate temperatures (21-22°C). The O₂ content was monitored at several timepoints during experimental sessions. To ensure that all genotypes received equivalent treatments, each experiment dish contained small numbers of both control and experimental heart preparations. HS or CH exposed flies were transported using a humidified chamber (Modular Incubator Chamber, MIC 101, Billups-Rothenberg) filled with calibrated 4% O₂ and kept at room temperature.

Heart function assays for hypoxia-selected (HS) fly populations: Heart function in HS and NC flies was analyzed using 3-week-old males. HS flies were removed from the 4% O₂ hypoxia chamber, briefly dissected under reduced oxygen conditions (hemolymph under stream of 4% O₂ duration <15 minutes), then returned to their 'native' 4% O₂ to equilibrate for 30 minutes prior to filming under 4% O₂ conditions (as in ³). To control for possible long-lasting effects of relatively elevated O₂ exposure during dissection of HS flies, we monitored heart function in both populations under their 'relative normoxia' condition (4% for HS or 21% O₂ for CH) at two timepoints (60 and 90 minutes) after dissection. Flies exhibited similar cardiac parameters at these timepoints, thus we used the average of the two measures as our values for baseline cardiac response at 'relative' normoxia for HS and CH, with appropriately timepoint-matched controls.

Heart function assays for chronic hypoxia (CH)-exposed flies: As previously described, we chose 3 weeks as the exposure period for the chronic hypoxia challenge, as this is the median age for *w¹¹¹⁸* adult flies and heart function is only moderately affected by aging ¹⁹. At 4% O₂ adult flies can live a near normal lifespan ²⁰, although they cannot reproduce (except HS flies ^{1,2}). Two- to three-day old adult flies were placed in sealed, humidified chambers at room temperature for 3 weeks under 4% O₂ with daily gas exchanges (as in ²⁰). Food (equilibrated for 24 hours at 4% O₂) was changed two times per week under hypoxic conditions. After 3 weeks,

HS or CH flies were removed from the chamber, dissected under normoxic conditions and equilibrated for 30 minutes in artificial hemolymph at 21% O₂ (NC and CH flies, and in all gene knockdown experiments), or at 4% O₂ (HS flies) prior to filming.

Statistical analysis: All statistical analyses were performed using Prism Statistical Software (Graph Pad, Inc). Data sets were first tested for normal (Gaussian) distributions using the D'Agostino and Pearson omnibus normality test. For data sets that passed this test, we used t-test, 1- or 2-way ANOVA, as appropriate. Most of the studies used two or more genotypes and two experimental conditions (normoxia vs. hypoxia), where significance was determined using a 2-way ANOVA followed by multiple comparisons post hoc tests, as appropriate (specific tests indicated in figure legends). Data sets that did not show a normal distribution (heart period and diastolic interval) were analyzed for significance using a nonparametric two-tailed t-test, or Kruskal–Wallis test followed by Dunn multiple comparisons post hoc tests, as appropriate (specific tests indicated in figure legends). We excluded hearts that did not beat after exposure to hypoxia (N<1% of total dataset, controls and experimental groups) or if cardiac parameters were outlier and fell outside 2 standard deviations of the population. In all cases, p<0.05 was taken as significant. In Supplemental Figures 3 and 4, a t-test was performed.

Supplemental Table 1 – Total of 449 upregulated genes and 622 downregulated genes in hearts from hypoxia-selected flies compared to normoxia controls.

Supplemental Table 2 – Total of 267 upregulated and 396 downregulated genes in chronic hypoxia hearts compared to *w¹¹¹⁸* controls.

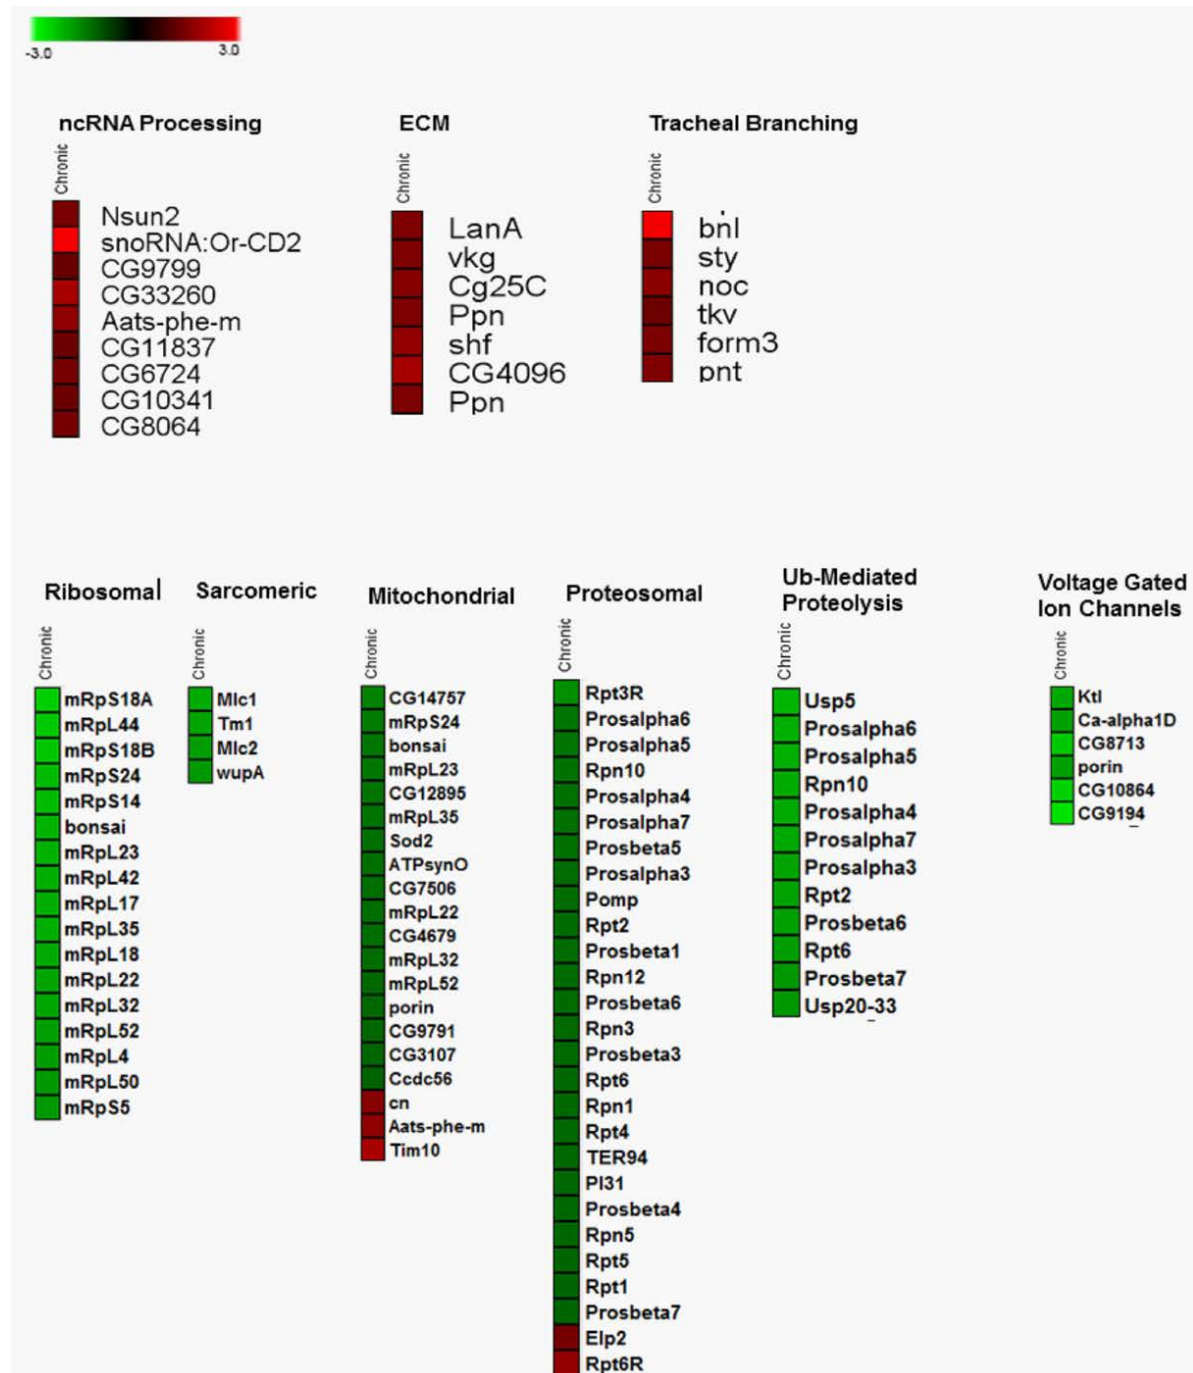

Supplemental Table 3 – Venn Analysis Between CH and HS Flies

SUPPLEMENTAL FIGURE 1: Cardiac-specific genes differentially expressed in hypoxia-selected and chronic hypoxia exposed fly populations.

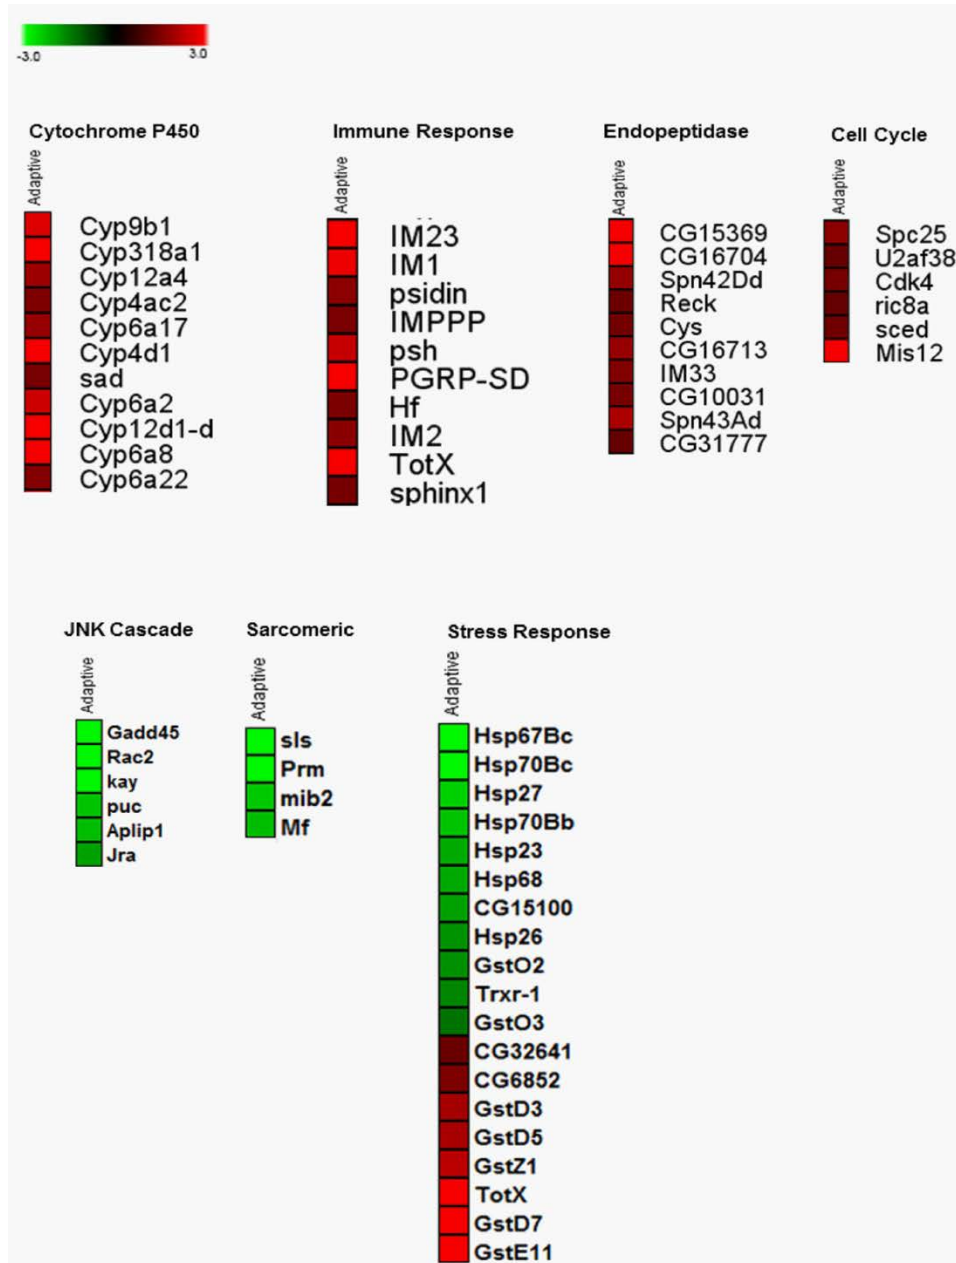

Supplemental Figure 1A: Differentially expressed genes in the heart of *Drosophila* exposed to chronic hypoxia (during adulthood) - or - selected for hypoxia tolerance over many generations (>250).

Supplemental Figure 1B: Differentially expressed genes in *w¹¹¹⁸* *Drosophila* exposed to chronic hypoxia (CH) compared to their normoxia-raised controls by cardiac-specific RNAseq.

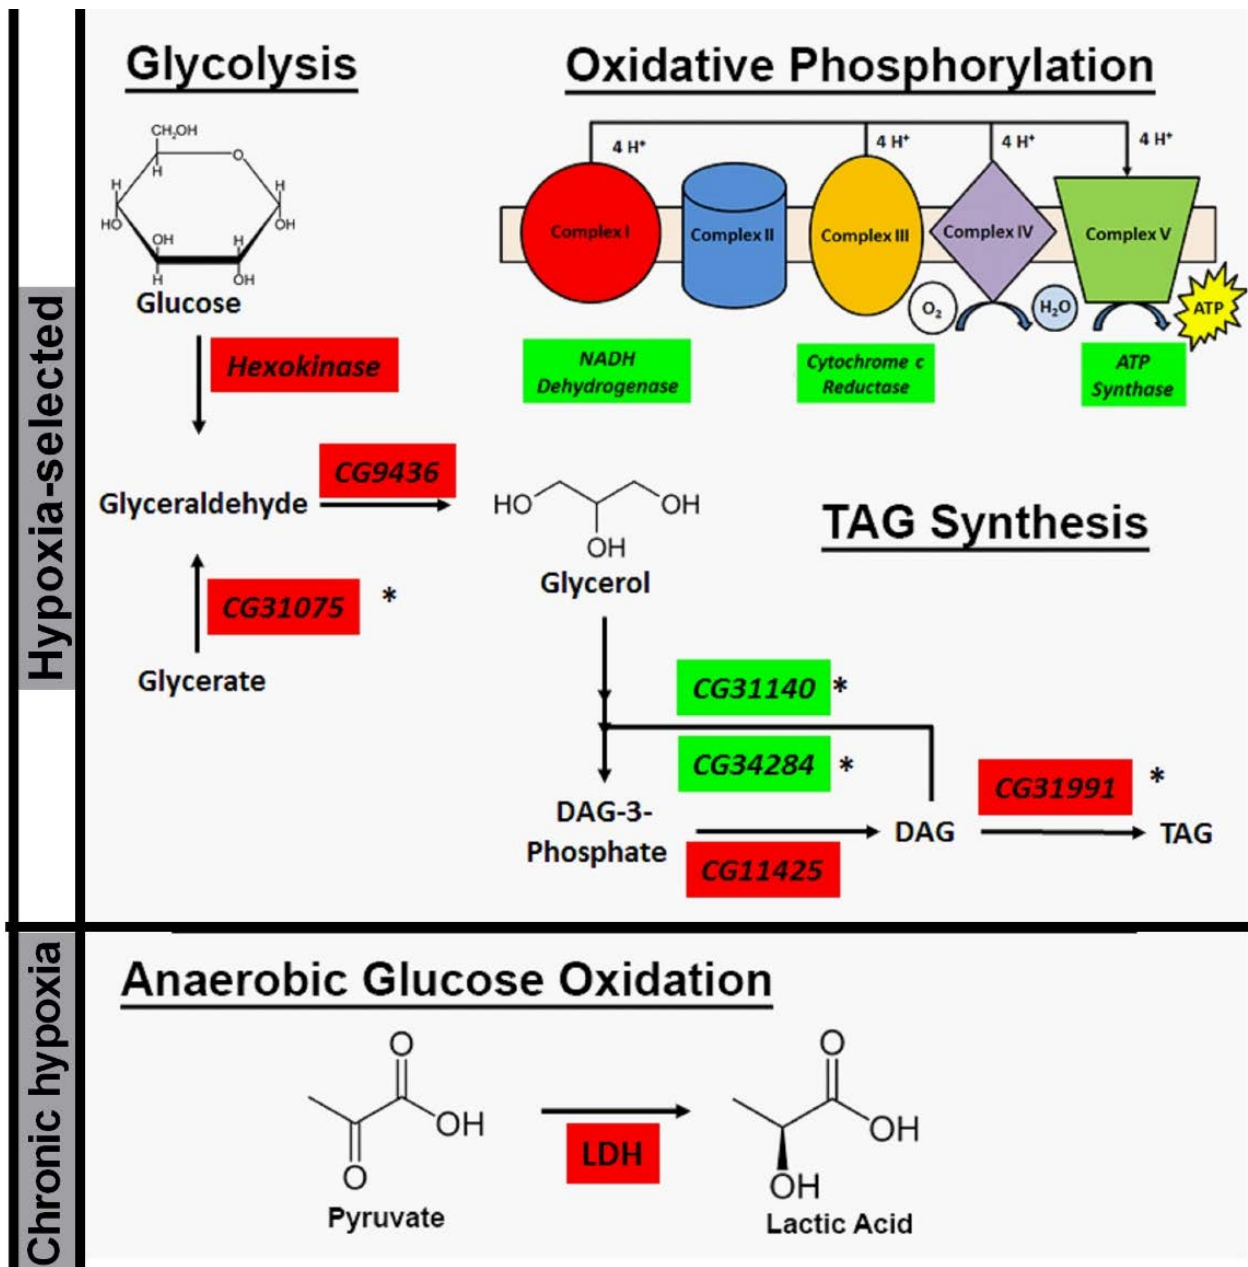

Supplemental Figure 1C: Differentially expressed genes in the heart of hypoxia-selected (HS) fly populations (>250 generations) compared to their control populations (NC) by microarrays.

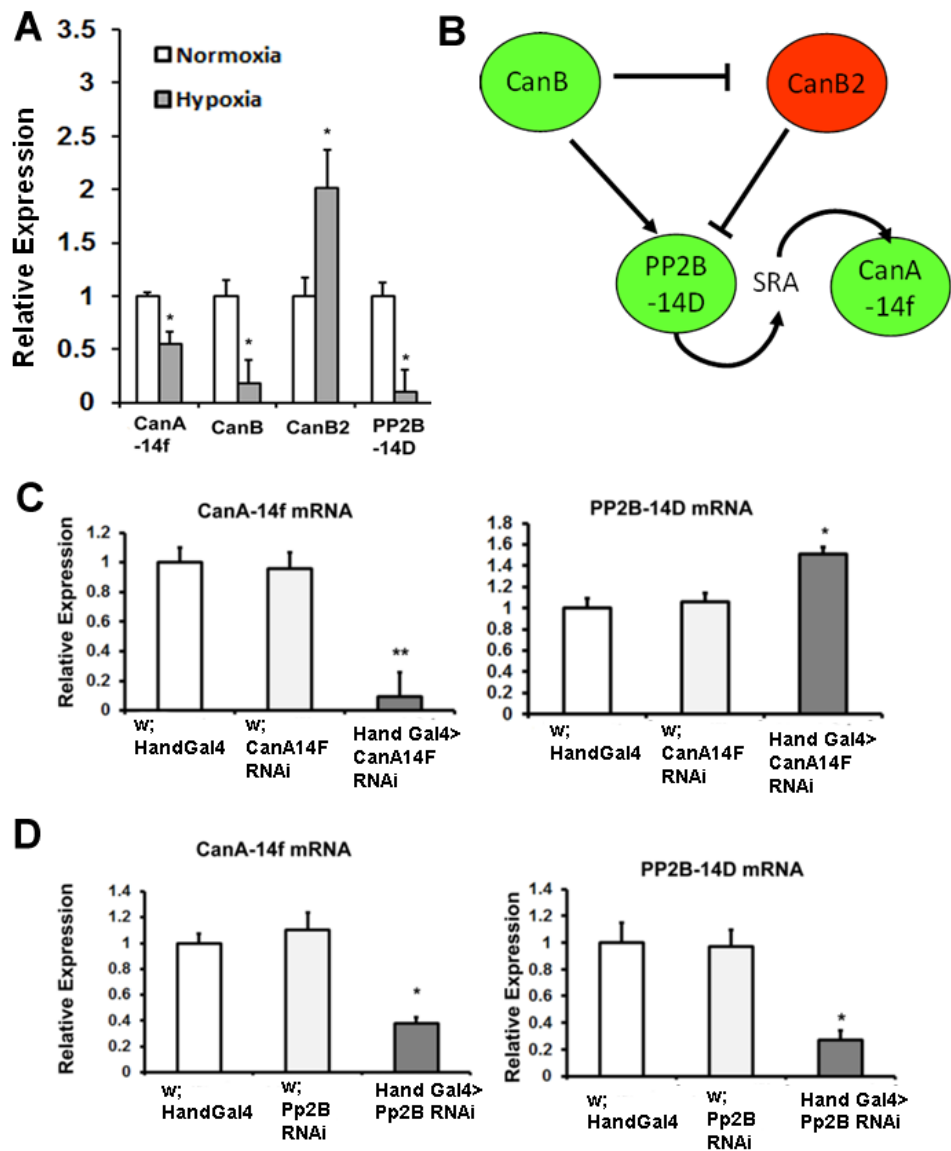

Supplemental Figure 1: Differentially expressed genes in the heart of hypoxia-selected and chronic hypoxia-exposed *Drosophila*. Cardiac-specific transcriptome analysis (from myocardial and pericardial cells) for differential gene expression in hypoxia-selected flies (HS) compared to chronic hypoxia-exposed *w¹¹¹⁸* flies (CH). **A)** Volcano plot for relative log₂ fold-change expression from HS vs. CH flies between genes found >1.2 fold up-regulated (red) or >1.2 fold down-regulated (green) in both populations or contra-regulated between the populations (orange). Transcriptome changes in the hearts of HS flies are open circles, and in the hearts of CH-exposed hearts are triangle points. **B)** Differentially expressed genes in the hearts of CH flies that are not found differentially expressed in the hearts of HS flies. Gene families are grouped by KEGG and DAVID ontologies by biological processes: non-coding RNA processing, extra-cellular matrix (ECM), tracheal branching (up-regulated); ribosomal function, sarcomeric function, mitochondrial function, proteosomal function, ubiquitin-mediated proteolysis and voltage-gated ion channels (mainly down-regulated). **C)** Differentially expressed genes in the hearts of HS flies compared to the hearts of NC flies. Gene families are grouped by KEGG and DAVID ontologies by biological processes: Cytochrome P450, immune response, endopeptidase function, cell cycle, JNK sarcomeric function, and the stress response.

Supplemental Figure 2: Hypoxia-dependent shift toward glycolysis and triglyceride storage in hypoxia-selected (HS) fly hearts, and towards anaerobic glucose oxidation in chronic hypoxia (CH) exposed fly hearts.

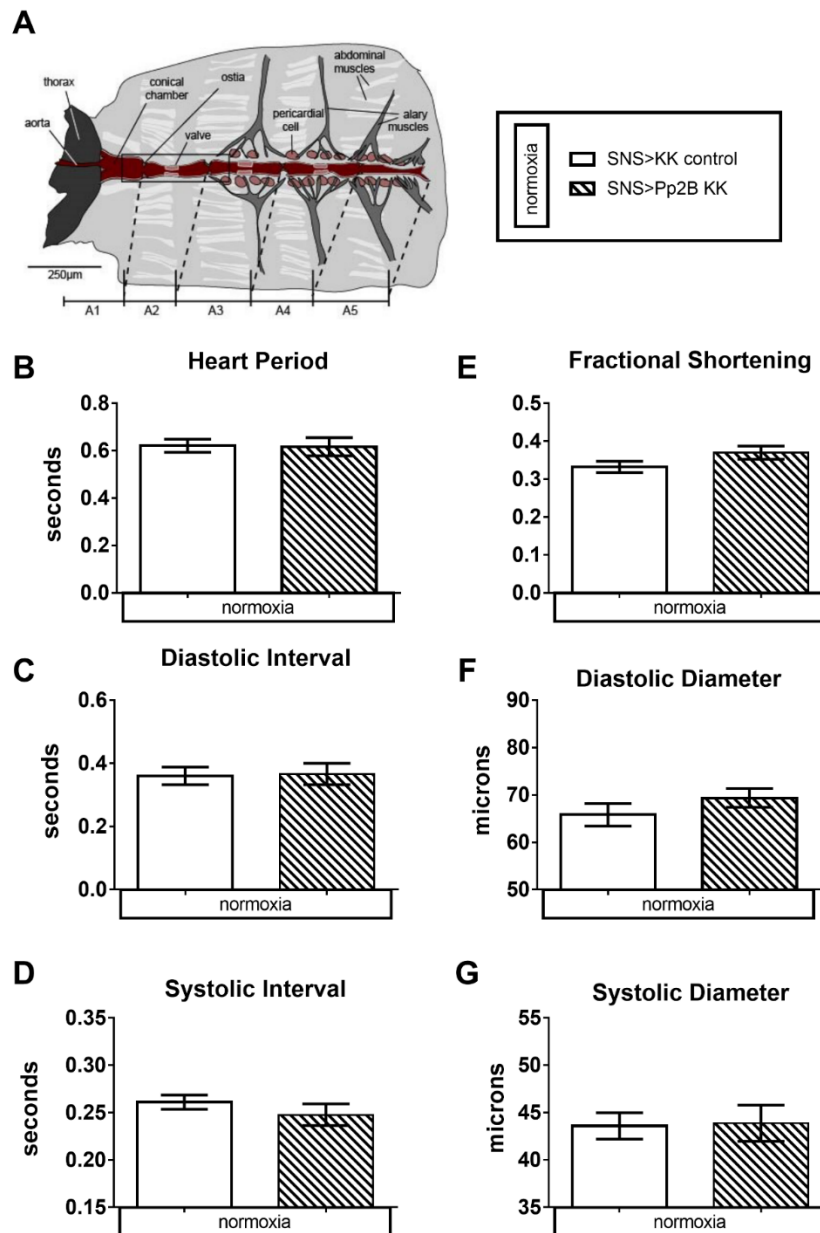

Supplemental Figure 2: Pathway analysis suggests a shift toward glycolysis and triglyceride storage in HS fly hearts, and towards anaerobic glucose oxidation in CH-exposed flies. (top) Cardiac microarrays of HS flies suggest a shift towards elevated expression of genes involved in glycolysis and triglyceride synthesis and decreased expression of genes involved in fatty acid oxidation. (bottom) Hearts from CH exposed flies showed increased expression of lactate dehydrogenase, suggesting a shift toward anaerobic metabolism.

Supplemental Figure 3: Differential expression in *Drosophila* Calcineurin gene network.

Supplemental Figure 3: Calcineurin Network Genes. A) Chronic Hypoxia (CH) induces differential expression of calcineurin network genes (qPCR relative expression). White bars: Normoxia grey bars: chronic hypoxia. These results validated those observed in the RNA seq experiment (Figure 2B). B) Putative Calcineurin network adapted from ExPasy as listed at www.flybase.org. Green: downregulation, Red: upregulation of expression. C) CanA14F and D) Pp2B heart-specific knockdowns. Expression of CanA14F and Pp2B was measured in the hearts of each KD line. (N=15 hearts/sample in quadruplicate). Data analysis: t-test *p<0.05.; **p<0.01.

Supplemental Figure 4: Effect of pericardial-specific knockdown of Calcineurin A on heart function.

Supplemental Figure 4: Effect of pericardial-specific knockdown of Pp2B on heart function. Heart function data was assessed under normoxia using the pericardial-specific driver SNS-Gal4⁷ to knockdown expression of Pp2B (SNS>Pp2B-RNAi), compared to control (SNS>KK control). A) Diagram of *Drosophila* heart tube within dissected abdominal preparation (adapted from⁵), illustrating pericardial cells selectively expressed with SNS-Gal4 driver. No statistical significance was observed in B) heart period, C) diastolic interval D) systolic interval, E) fractional shortening, F) diastolic diameter or G) systolic diameter. Data analysis: t-test * $p < 0.05$. SNS>KK control N=24, SNS>Pp2B-RNAi N=19.
