

Supplementary Figure 3

Supplementary Figure 3: The possible interactions of miR-106a-5p with EMT markers. After transfection with mimics, the protein levels of PAK5 and N-cadherin were downregulated accompanying E-cadherin was upregulated. On the contrary, inhibition of miR-106a-5p could upregulate the protein levels of PAK5 and N-cadherin following with downregulation of E-cadherin. The mock group was used as a control.
