Figure FS1. SEM view of the vacuum dried original TiO₂ sol diluted by isotonic NaCl solution 1:1 by volume.

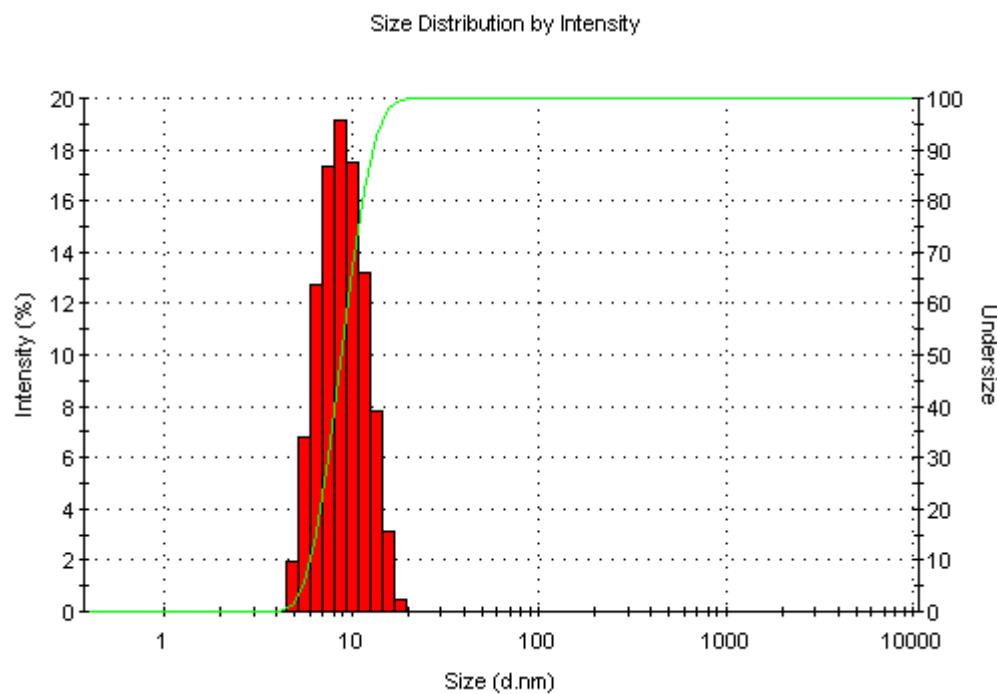

Figure FS2 Size distribution of the TiO₂ nanoparticles in the sol diluted by isotonic NaCl solution 1:1 by volume.

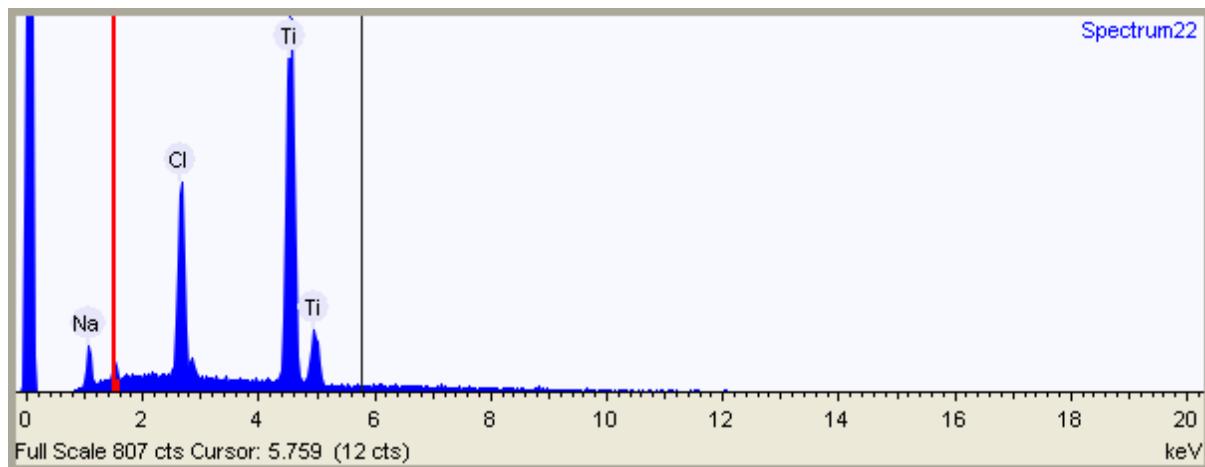

Figure FS3. EDS spectrum of the vacuum dried original TiO_2 sol diluted by isotonic NaCl solution 1:1 by volume.

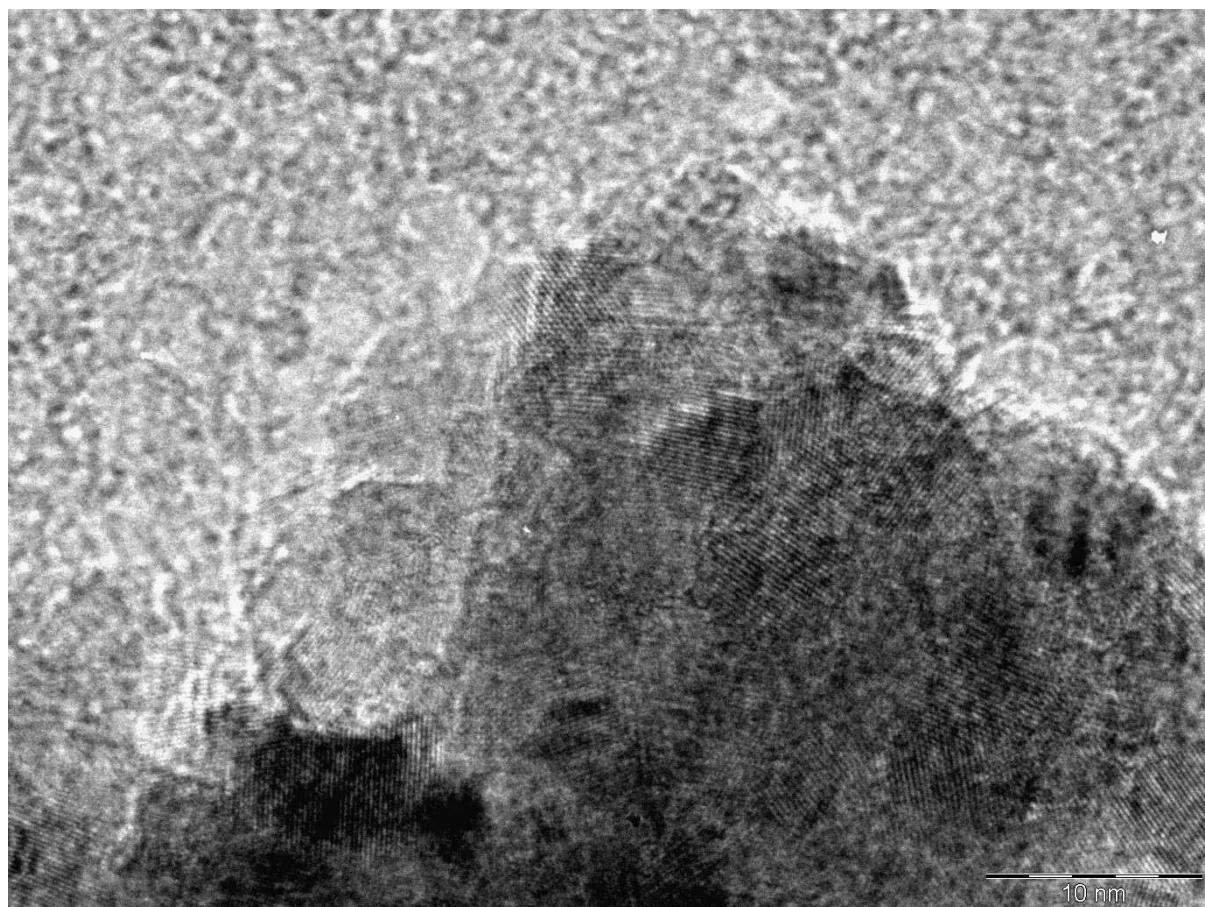

Figure FS4. TEM view of the TiO_2 nanoparticles in an air-dried droplet of the sol.

Table TS1 Results of EDS analysis with normalized content of all identified elements

TiO₂ coating on a blood clot

Element	Weight %
Chlorine	0.9
Potassium	1.0
Titanium	98.1

Inner part of the TiO₂ coated blood clot

Element	Weight %
Sodium	1.9
Magnesium	6.1
Phosphorus	13.3
Sulfur	44.7
Potassium	20.6
Calcium	2.2
Titanium	2.5
Iron	8.6

Table TS2 Wound size development in the % of the initial size.

Figure FS5. Concentrations of TiO₂ in the liver of the rats treated and untreated (control) by nano dispersion measured on the day 28 from the start in an repeated experiment

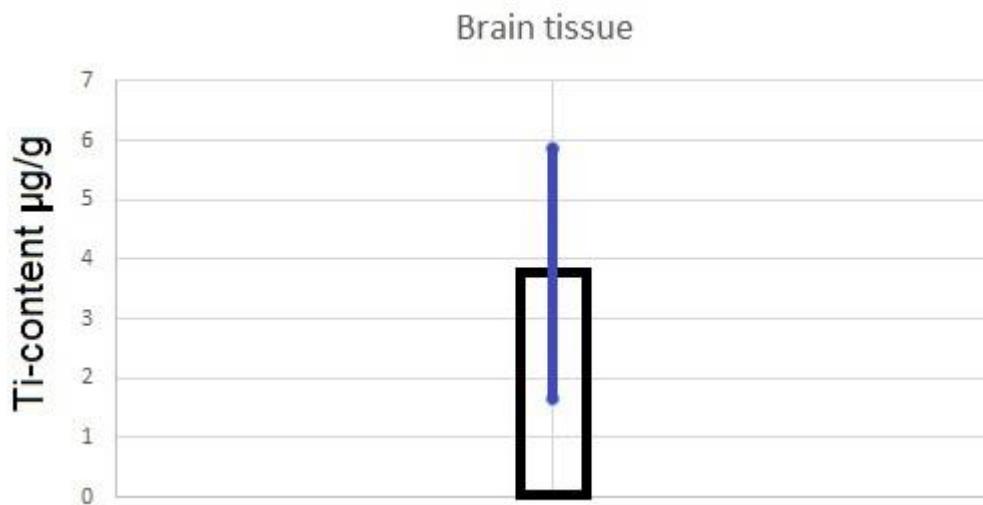

Figure FS6. Concentrations of TiO₂ in the brain tissue of the rats treated with titania. The observed value of 3.77 ± 2.11 µg/g is well corresponding to that generally observed in rats in this kind of tissue (see, for example, I.Grissa et al. *Environ Sci Pollut Res*, **2016**, 23, 20205–20213; X.Y. Gao, *Biol Trace Elem Res*, **2011**, 143, 1616–1628; H.B. Shi et al. *Particle & Fibre Toxicol*, **2013**, 10, 15 (1-33). doi: 10.1186/1743-8977-10-15).
