

Global and Regional Effects of Bladder Cancer Risk Associated with Pioglitazone Therapy in Patients with Diabetes

A Systematic Review and Meta-Analysis

^aTrials used the same categories that were used in the interim analysis of the Kaiser Permanente Northern California (KPNC) study.

^bTrials used categories which were partly consistent with the one in the interim analysis of the KPNC study.

^cTrials used categories which were inconsistent with the one in the interim analysis of the KPNC study.

^dMedian age (years).

eTable 2. Quality Assessment of Studies Regarding Bladder Cancer Risk and Pioglitazone Use

Author (year)	Ascertainment of diabetes	Representativeness of the exposed cohort	Selection of the non-exposed cohort	Ascertainment of exposure to pioglitazone	Demonstration that outcome of interest was not present at start of study	Comparability of study controls for important factors	Assessment of outcome	Completeness of outcome	Score
Tseng et al, ¹³ (2012)	T2DM were identified based on ICD-9 codes 250.1–250.9	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Statement not explicit; likely from the drug prescription in the electronic medical records	Yes, patients who had bladder cancer before entry were excluded	Cox regression was used to estimate confounders, including age, sex, diabetes duration, nephropathy, urinary tract disease, hypertension, other combined disease, other diabetes medications, statin, fibrate, ACE inhibitor/angiotensin receptor blocker, calcium channel blocker, region of residence, occupation, and other cancer before baseline, extracted by ICD-9 codes	Bladder cancer was identified based on ICD-9 codes 188.xx	Authors did not mention the completeness of outcome	8
Mamtani et al, ¹⁵ (2012)	Statement not explicit; T2DM likely identified from database	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Drug prescription in the electronic medical records	Yes, patients who had bladder cancer before entry were excluded	Cox proportional hazards regression models were used to estimate potential confounders, including other diabetes medications and variables believed to affect either the risk of bladder cancer or the probability of receiving a TZD	Bladder cancer was identified by The Read Codes (Version 2)	Authors did not mention the completeness of outcome	8

Neumann et al, ⁶ (2012)	Statement not explicit; DM likely from identifying ICD-9 code in the database	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Drug prescription in the electronic medical records	Yes, patients had bladder cancer diagnosed before study entry or within the first 6 months after study entry were excluded	Cox proportional hazard models were used to estimate covariates, including age, sex and use of other glucose-lowering drugs	Bladder cancer was identified by ICD-10 code C67 and specific surgical procedure and/or intravesical instillation of pharmacological product by urethral catheter and/or chemotherapy and/or radiation therapy performed during the same hospital stay	Authors did not mention the completeness of outcome	8
Wei et al, ¹⁷ (2012)	T2DM was defined based on the record of General Practice Research Database (GPRD) during the study period	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Drug prescription in the electronic medical records	Yes, the study outcome was bladder cancer during the follow-up period	Cox proportional hazard model was used to adjust for age, gender, smoking status, BMI and duration of diabetes	Data collected during the follow up	There were 45 and 3683 subjects with missing data about smoking history, and 499 and 11948 subjects with missing data about BMI in pioglitazone treatment group and other oral hypoglycaemic drugs treatment group, respectively	9

Fujimoto et al, ¹⁸ (2013)	Statement not explicit; T2DM identified likely from database	NR	Selection of the non-exposed cohort	Statement not explicit; likely from the drug prescription in the database	Yes, patients who had bladder cancer before entry were excluded.	No adjusted analysis was conducted	Statement not explicit; likely identified from the database	Authors did not mention the completeness of outcome	5
Vallarino et al, ² (2013)	T2DM identified by ICD-9 codes 250.x0 or 250.x2	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Statement not explicit; likely from the drug prescription in the database	Yes, patients who had bladder cancer before entry were excluded	Cox regression models were used to estimate covariates, including demographics, use of medications and medical history	Bladder cancer was identified based on ICD-9 codes 188.xx, 233.7	Authors did not mention the completeness of outcome	8
Balaji et al, ²⁰ (2014)	DM was identified by medical records screening from the hospital	NR	Drawn from the same population as the exposed cohort	Statement not explicit; likely identified by medical records screening from the hospital	NR	NR	Bladder cancer cases were identified by medical records screening from the hospital	Authors did not mention the completeness of outcome	4
Lee et al, ²¹ (2014)	T2DM identified by ICD-9-CM code 250.1–250.9	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	From the drug prescription in the database	Yes, patients who had bladder cancer before entry were excluded.	Cox regression analysis was used to estimate confounders, including sex, age, duration of diabetes, other diabetes medications, income, residential area, nephritis, chronic kidney disease, kidney infections, hydronephrosis, calculus of the lower urinary tract, cystitis, other disorders of the urethra and urinary tract, hypertension and hyperlipidemia	Bladder cancer cases were identified according to ICD-9-CM code 188 and were confirmed by the issuance of catastrophic illness cards	Authors did not mention the completeness of outcome	8

Jin et al, ²² (2014)	Statement not explicit; T2DM likely identified from database	NR	Drawn from the same population as the exposed cohort	From the drug prescription in the database	Yes, patients who had bladder cancer before entry were excluded	Cox regression model was used to control for age at baseline and sex	Bladder cancer cases were identified according to ICD-10 code C67	Authors did not mention the completeness of outcome	6
Lewis et al, ³ (2015)	DM identified basis of hospital and physician diagnoses, prescription medications, and laboratory tests.	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	From the drug prescription in the database	Yes, patients with a diagnosis of bladder cancer before entry or within 6 months of entry were excluded	Cox regression analysis was used to estimate confounders, including age, sex, and year of cohort entry, use of other diabetes medication, smoking, race/ethnicity, other diabetes medications, other bladder conditions, median household income, congestive heart failure, cancer other than bladder cancer, renal insufficiency, HbA1c and the interaction with new diagnosis of diabetes, and duration of diabetes, the 3-level time-updated proteinuria testing variable	Bladder cancer cases were identified from the KPNC cancer registry, which reports to the California Cancer Registry and the National Cancer Institute's Surveillance, Epidemiology and End Results program of registries	There were missing data regarding race/ethnicity, renal function at baseline, income, baseline HbA1c, and diabetes duration at baseline, in the pioglitazone group and never use group, respectively	9
Erdmann et al, ⁵ (2016)	T2DM patients identified by physicians	NR	Drawn from the same population as the exposed cohort	Drug prescription in the routine clinical practice	Statement not explicit; 11 patients were diagnosed bladder cancer within 1 years	There were no adjustments have been done.	Statement not explicit; likely from the data collected during the follow up	A similar percentage of patients on pioglitazone or placebo groups withdrew consent to follow-up (<1%), were confirmed lost to follow-up	6

								(~9%), and had an unconfirmed status [i.e. last contact ≥ 9 years (<5%)].	
Tuccori et al, ²⁴ (2016)	T2DM was identified by Read code from the database	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	A coded drug dictionary based on the UK Prescription Pricing Authority Dictionary is used to record prescriptions	Yes, patients who had bladder cancer before entry were excluded	Time dependent Cox proportional hazards models were used to estimate covariates, including age, sex, year of cohort entry, body mass index, smoking status, alcohol related disorders, HbA1c, duration of treated diabetes, previous bladder conditions, history of cancer, presence of at least one urine protein test in the year before cohort entry, and Charlson comorbidity score 26	Bladder cancer was identified by Read code from the database	There were 9 and 1530 patients with unknown data about BMI, 14 and 3434 patients with unknown data about smoking, 236 and 49,480 patients with unknown data about HbA1c, in pioglitazone group and no pioglitazone group, respectively	9
Korhonen et al, ²⁵ (2016)	T2DM was identified from database	Generally representative of the population in corresponding region	Drawn from the same population as the exposed cohort	Drug use data were based on outpatient prescription data and outpatient dispensing data	Yes, patients with histories of malignant or benign bladder neoplasms were excluded	Age, sex, metformin use, sulfonylurea use, insulin use, use of other diabetes drugs, all exact matching variables, propensity scores, and all propensity score variables evaluated at cohort entry date	Bladder cancer cases were identified from cancer registries and hospital records	Authors did not mention the completeness of outcome	8

Gupta et al, ⁴ (2015)	Statement not explicit; T2DM likely identified from database	NR	Drawn from the same population as the exposed cohort	Statement not explicit; likely from the drug prescription in the database	NR	NR	Bladder cancer was assessed by taking history and detailed urinary analysis including urine routine, microscopy, hematuria, and cytology examination	Authors did not mention the completeness of outcome	4
----------------------------------	--	----	--	---	----	----	--	---	---

Author (year)	Is case definition adequate	Ascertainment of diabetes	Representativeness of the cases	Selection of controls	Definition of controls	Comparability of study controls for important factors	Ascertainment of exposure to pioglitazone	Same method of ascertainment for exposure to pioglitazone in both arms	Completeness of data within database	Score
---------------	-----------------------------	---------------------------	---------------------------------	-----------------------	------------------------	---	---	--	--------------------------------------	-------

Azoulay et al, ¹⁴ (2012)	Statement not explicit; likely from identifying the clinical diagnoses according to the ICD codes	Statement not explicit; T2DM likely from identifying patients newly treated with noninsulin antidiabetic drugs	Representative of the population in corresponding region	Up to 20 controls were randomly selected from the case's risk set, after matching on year of birth, year of cohort entry, sex, and duration of follow-up. And all controls were alive, had no previous diagnosis of bladder cancer	Patients had no previous diagnosis of bladder cancer	Conditional logistic models were used to control for year of birth, year of cohort entry, sex, and duration of follow-up, HbA1c, excessive alcohol use, obesity, smoking, previous cancer, previous bladder conditions, and Charlson comorbidity score	Statement not explicit; likely from the drug prescription in the electronic medical records	Yes, both cases and controls who had been prescribed TZDs identified with claims database	Authors did not mention the completeness of data in the database, however, HbA1c information was reported as missing for 19% of the cases and controls	9
Chang et al, ⁸ (2012)	All potential cases were validated by a linkage through National Cancer Registry	T2DM patients were identified by diagnostic codes (ICD-9-CM)	Obviously representative series of cases in corresponding region	A risk-set sampling matched by age, sex, and the number of days of follow-up was used to find controls for the cohort	Patients had no previous diagnosis of bladder cancer	Conditional logistic regression was used to test potential covariates, including socioeconomic status, diabetes complications and comorbidities at cancer diagnosis, other antidiabetic agents, antihypertensive medications, statin, and aspirin	From the outpatient pharmacy prescription database	Statement not explicit; likely from the outpatient pharmacy prescription database	Authors did not mention the completeness of data in the database	9

Song et al, ¹⁶ (2012)	Bladder cancer diagnosis confirmed by cytology	Statement not explicit; T2DM patients likely identified from electronic medical records	Obviously representative series of cases in corresponding region	Age- and sex-matched diabetics without bladder cancer were enrolled as the control group	Patients had no previous diagnosis of bladder cancer	Multivariate conditional logistic regression model was used to determine the factors, such as, age, sex, duration of diabetes, obesity, alcohol, smoking, and anti-diabetic agents, and potential underlining medical conditions	Statement not explicit; likely from the drug prescription in the electronic medical records	Statement not explicit; likely from the drug prescription in the electronic medical records	Authors did not mention the completeness of data in the database, but to avoid incomplete or missing data on potential confounders, authors were selected from the Severance diabetes registry	9
Hsiao et al, ¹⁹ (2013)	Diagnosis of bladder cancer was identified by ICD-9-CM codes: 188.xx	Diagnosis of T2DM identified by ICD-9-CM code 250.xx	Obviously representative series of cases in corresponding region	For each case, five matched controls were randomly selected from the same diabetic cohort using the incidence density sampling approach, and were matched to the cases for age, sex and entry date	Statement not explicit; likely patients without bladder cancer	Multivariable conditional logistic regressions were used to estimate the associated factors, including duration of diabetes, co-morbid conditions and concomitant medications. Co-morbid conditions included chronic renal failure, bladder conditions and chronic obstructive pulmonary disease (COPD)	The exposure to pioglitazone was based on identified prescriptions	Yes, both cases and controls who had been prescribed pioglitazone identified from claims database	Authors did not mention the completeness of data in the database	9

Kuo et al,²³ (2014) Diagnoses of bladder cancer was identified by ICD-9 188.** codes T2DM patients were identified by diagnostic codes for diabetes ICD-9-CM Obviously representative series of cases in corresponding region For each case, four control individuals were randomly selected from the set of all eligible controls, and matched to the cases by sex, age, and time from entry into cohort to the index date Patients had no previous diagnosis of bladder cancer Conditional logistic regression model was used to estimate relative factors, including documented risk factors for bladder cancer and comorbidities, were retrieved by ICD-9 codes Information on pioglitazone exposure was extracted from the prescription database Statement not explicit, likely extracted from the prescription database Authors did not mention the completeness of data in the databaseBMIH 9

Author (year)	Randomization sequence generation	Allocation concealment	Blinding of participants and personnel	Blinded assessment bladder cancer events	Incomplete outcome data	Selective reporting

eAppendix 2. MOOSE Guidelines Checklist

Criteria		Brief description of how the criteria were handled in the meta-analysis
Reporting of background should include		
√	Problem definition	The association between pioglitazone use and bladder cancer risk was announced and debated for many years.
√	Hypothesis statement	Pioglitazone use may be associated with increased bladder cancer risk.
√	Description of study outcome(s)	Bladder and other cancer risks.
√	Type of exposure or intervention used	Pioglitazone use.
√	Type of study designs used	We included observational studies and randomized controlled trials.
√	Study population	Patients with diabetes.
Reporting of search strategy should include		
√	Qualifications of searchers	The credentials of all investigators are indicated in the author list.
√	Search strategy, including time period included in the synthesis and keywords	Three authors performed the literature search from the inception through Jan, 5 2017 without language restriction.
√	Databases and registries searched	Embase, PubMed, Web of Science, Cochrane Library, and ClinicalTrials.gov.
√	Search software used, name and version, including special features used	No specific search software was employed. Endnote was used to eliminate duplications.
√	Use of hand searching	We hand-searched bibliographies of retrieved manuscripts for additional references.
√	List of citations located and those excluded, including justification	Details of the literature search process are presented in the Figure 1.
√	Method of addressing articles published in languages other than English	We placed no restrictions on language. If necessary, we resorted to our colleagues who fluent in the corresponding language for translation.
√	Method of handling abstracts and unpublished studies	We contacted a few authors to make clarifications regarding their unpublished studies, but none of these studies were included in our analyses.
√	Description of any contact with authors	Not available.
Reporting of methods should include		
√	Description of relevance or appropriateness of studies assembled for assessing the hypothesis to be tested	The inclusion and exclusion criteria were described in the methods section.
√	Rationale for the selection and coding of data	Data extracted from each study were relevant to the study design, population characteristics, exposure and control conditions, outcome, etc.
√	Assessment of confounding	Subgroup and sensitivity analyses were performed to address potential confounders.

√	Assessment of study quality, including blinding of quality assessors; stratification or regression on possible predictors of study results	The Newcastle-Ottawa quality assessment scale and the Cochrane Collaboration's tool were used to assess the study quality.
√	Assessment of heterogeneity	The heterogeneity was evaluated by the use of I-squared for all analyses.
√	Description of statistical methods in sufficient detail to be replicated	Description of methods, subgroup analyses, sensitivity analyses, and assessment of publication bias are all detailed in the methods section.
√	Provision of appropriate tables and graphics	Five figures, one table, one eAppendix, nine efigures and two eables were provided.
Reporting of results should include		
√	Graphic summarizing individual study estimates and overall estimate	Figure 2
√	Table giving descriptive information for each study included	eTable 1
√	Results of sensitivity testing	Results section.
√	Indication of statistical uncertainty of findings	95% confidence intervals were presented with all summary estimates.
Reporting of discussion should include		
√	Quantitative assessment of bias	No significant publication bias presented in our study, and sensitivity analyses were performed to quantify potential biases.
√	Justification for exclusion	We excluded studies that didn't relevant to pioglitazone and cancer incidence.
√	Assessment of quality of included studies	The study quality was reported both in the eTable 2 and sensitivity analysis section.
Reporting of conclusions should include		
√	Consideration of alternative explanations for observed results	Alternative explanations were provided in the discussion section.
√	Generalization of the conclusions	Our results are generalizable as we included studies from different population regions.
√	Guidelines for future research	We make recommendations in the discussion section.
√	Disclosure of funding source	This study was supported by grants from National Key R&D Program of China (No. 2016YFC1101100), National Natural Science Foundation of China (No. 81471039, No. 81270893, No. 81228023 and No. 81401601, and No.81402202) and the Natural Science Foundation Project of Chongqing (CSTC2014jcyjqq10006, CSTC2012jjB10023, and CSTC2016jcyjA0518).
