## Figure S1

**Fig. S1. Probe design for M-795, M-3564, L-533, L-3104, and L-3750.** We designed two Taqman DNA probes at the M-795, M-3564, L-533, L-3104, and L-3750 sites. One probe was 5' conjugated with either hexachlorofluorescein (HEX; Absorbance max: 535 nm; Emission max: 556 nm) to detect parental MP-12 genotype, or 6-carboxyfluorescein (6-FAM; Absorbance max: 494 nm; Emission max: 518 nm) to detect mutant genotype reverted to pathogenic genotype. The other probe was 3' conjugated with Black Hole Quencher-1 (BHQ-1). Sequences of probes and primers are shown in Table S2.

## Figure S2

**Fig. S2. Validation of ddPCR using Taqman probes for M-795, M-3564, L-533, L-3104, and L-3750.** The accuracy of ddPCR assays were validated using five different Taqman probe sets. Full-length MP-12 M- or L-segment RNAs were in vitro synthesized by MEGAscript T7 Transcription kit (Thermofisher), using linearized pProT7-vM(+) or pProT7-vL(+) plasmids, respectively. In vitro synthesized full-length M- or L-segment RNAs encoding M-C795U, M-G3564A, L-C533U, L-A3104G, or L-A3750G (mutant RNA) were prepared. Synthesized parental MP-12 RNA and mutant RNA were mixed at ratios of 100:0, 0:100, 100:1, 100:0.1, 100:0.01, or 0.1:100. First-stranded cDNA was then synthesized and ddPCR was performed, as described in Material and Methods. The ddPCR results for M-795 (a), M-3564 (b), L-533 (c), L-3104 (d), and L-3750 (e) are shown. The graph represents the relative percentage of parental and mutant genotype RNA copy numbers. Bottom panels represent the raw images of QX100 Droplet Reader output [parental (HEX): mutant (FAM) = 100:1].
