

Supplementary Figure 1. Definition of transcriptional states of genes in HFs

Definition of transcriptional states of genes (bivalent, active, repressive and other gene groups). Top heatmap represents the occupancy of each chromatin state (%) within TSS ± 250 bp for all refseq genes in HFs (NHLFs). Bottom heatmaps indicate H3K4me3 and H3K27me3 modification profiles (RPM values) around TSS for active, repressive and bivalent genes defined by chromatin states in HFs (NHLFs). Histone modification profiles are shown within TSS ± 2 Kb.

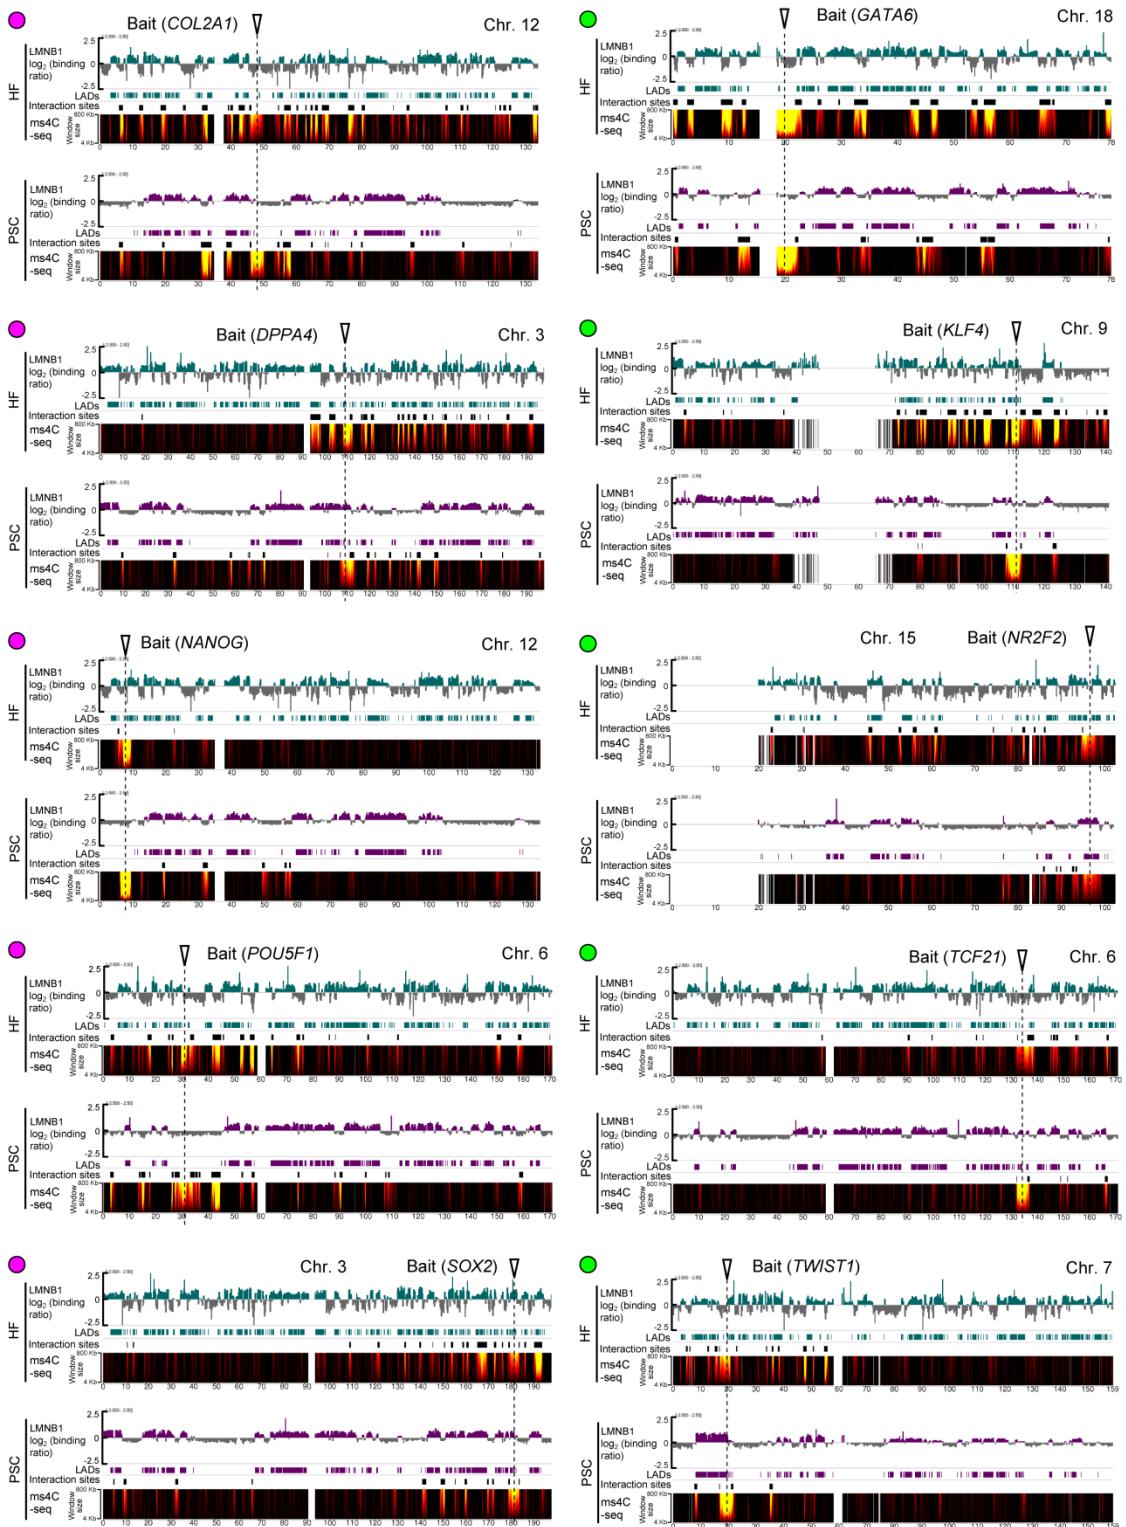

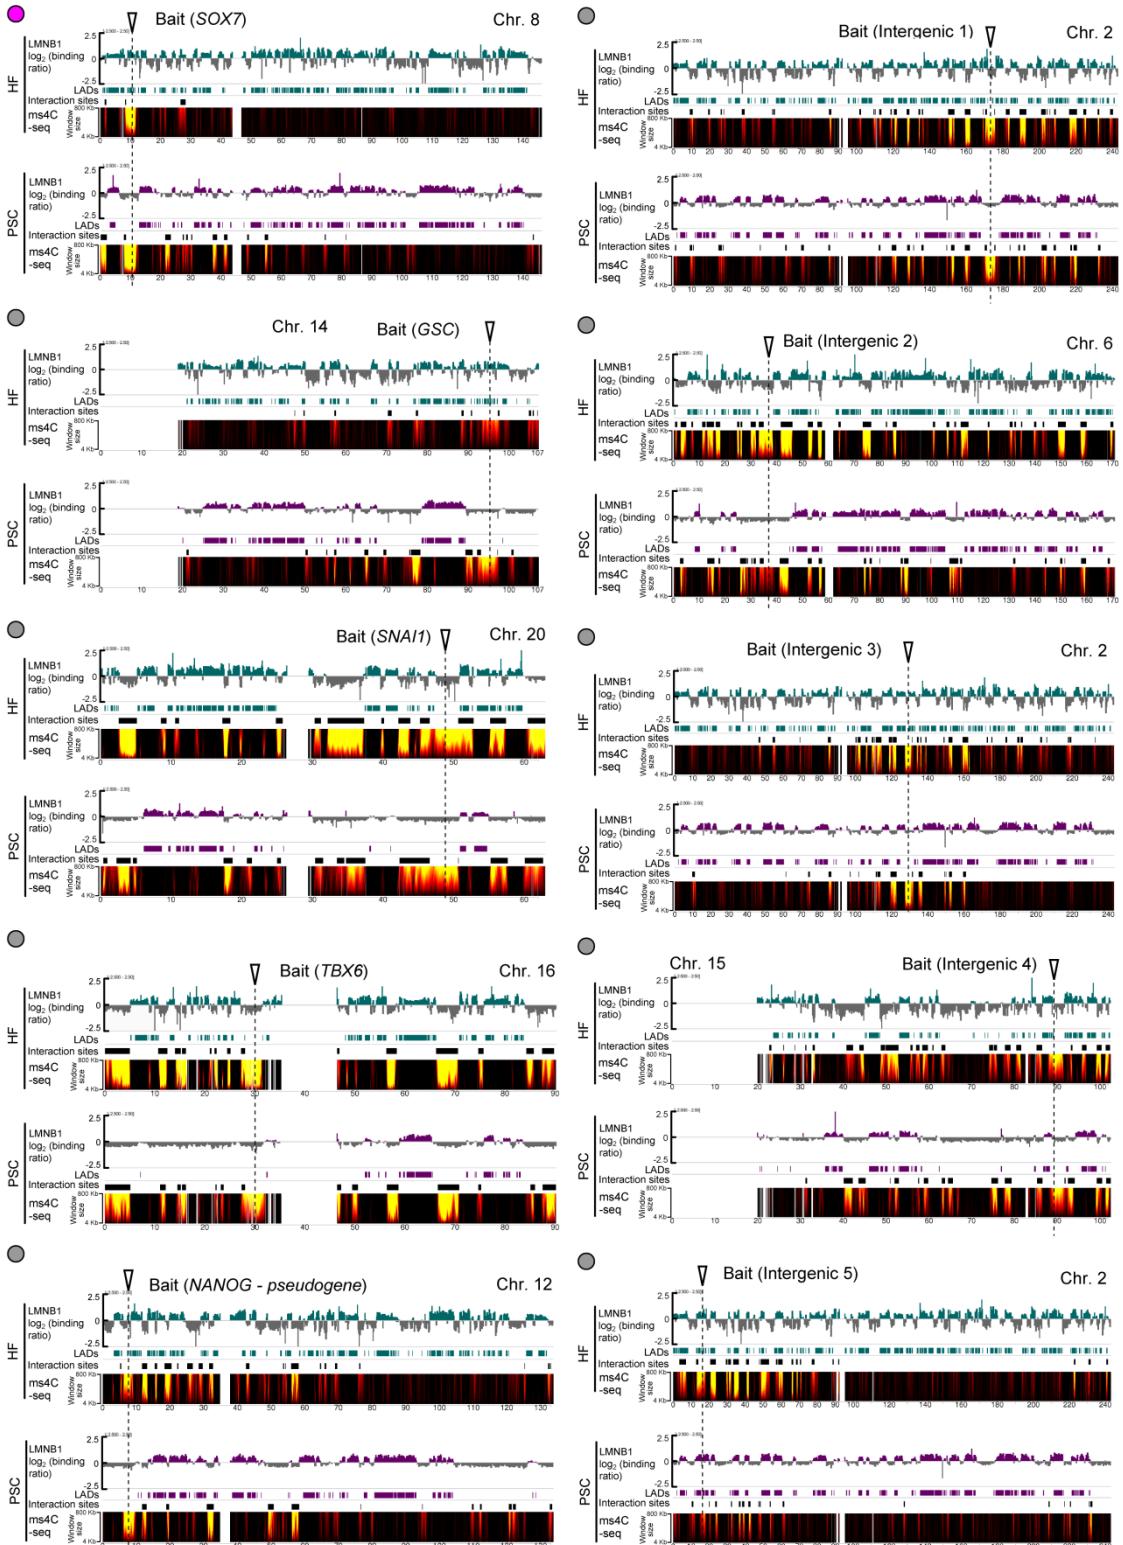

Supplementary Figure 2. Analysis of ms3-seq data

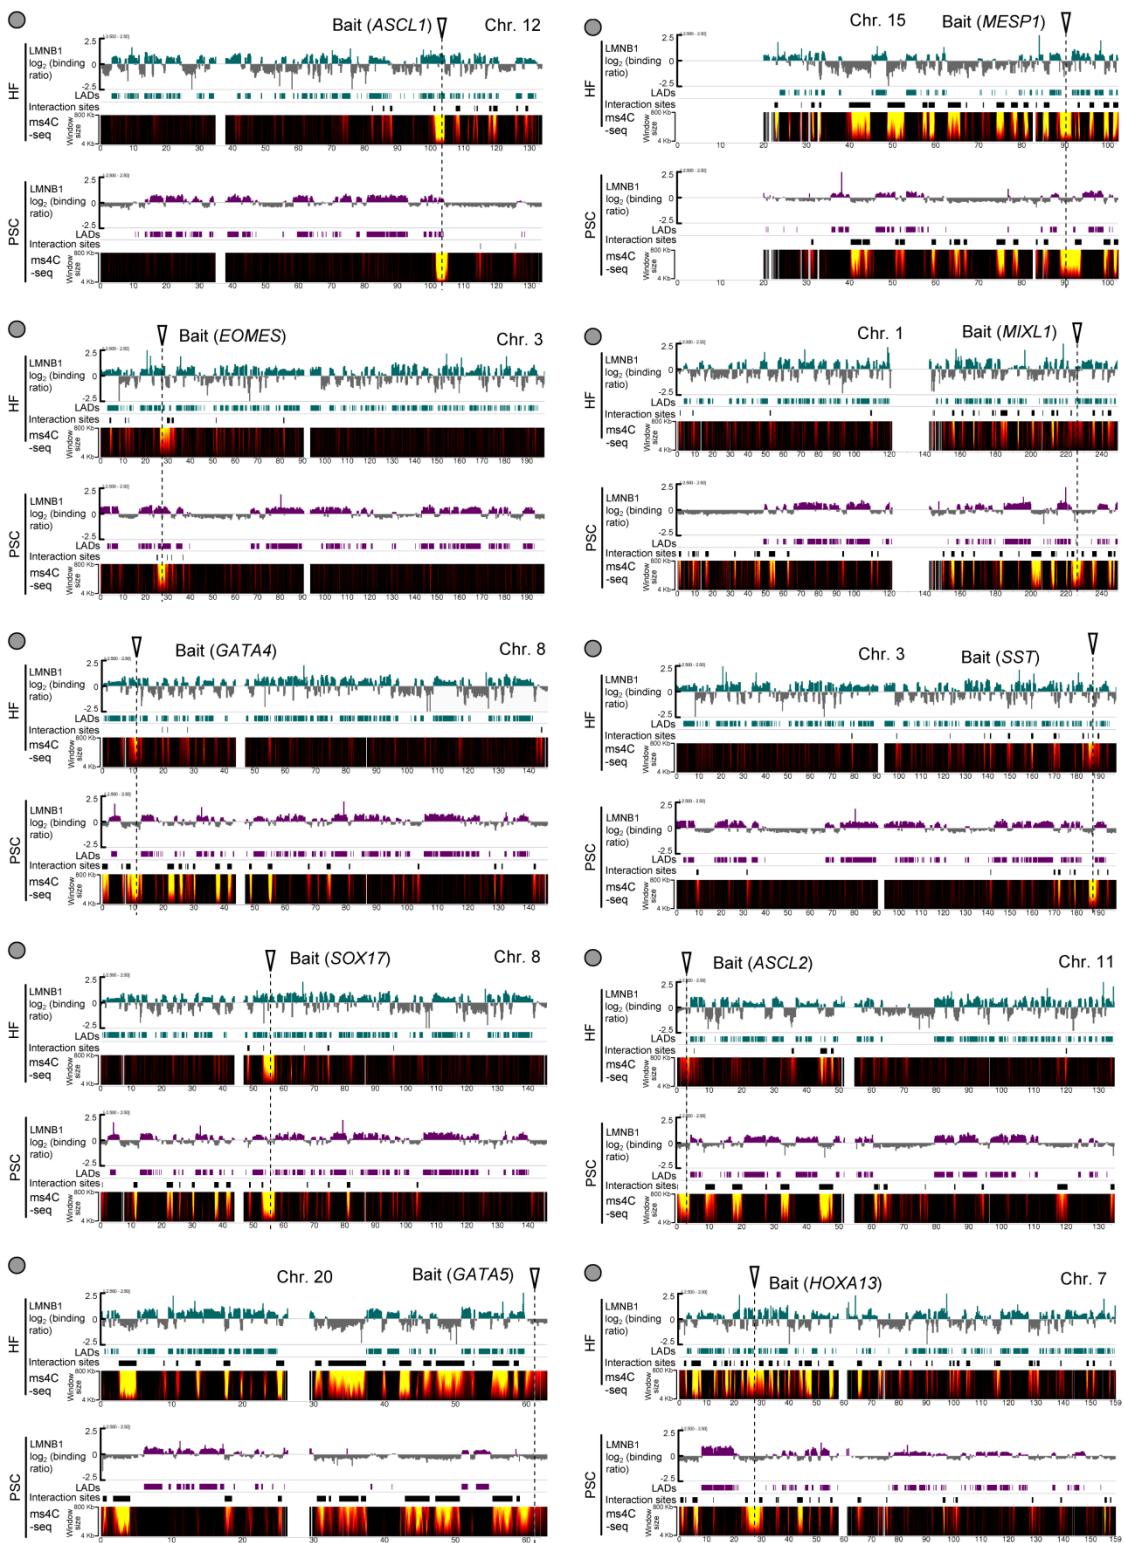

- (a)** Profile of the cis-chromosomal interaction in the *TWIST1* gene locus in HFs (HDFs). Chromatin interaction frequencies in the *TWIST1* gene locus are shown as described in Fig. 1c.
- (b)** Analysis of chromatin interactions with 3D DNA FISH in HFs (HDFs). Colocalization percentage of cis-interaction target loci in *TWIST1*. The left panel illustrates the relative positions of the positive (*EGFR*) and negative (*INHBA*) interaction target loci for the bait (*TWIST1*) locus on the genome. The bar graph shows the colocalization percentage between the bait (*TWIST1*) locus and the positive (magenta) or negative (green) interaction loci (n = 180, Fisher's exact one-sided test, *p < 0.03). Nuclei were stained with Hoechst (blue). Bait locus (*TWIST1*), interaction positive locus (*EGFR*) and interaction negative locus (*INHBA*) are indicated as white,

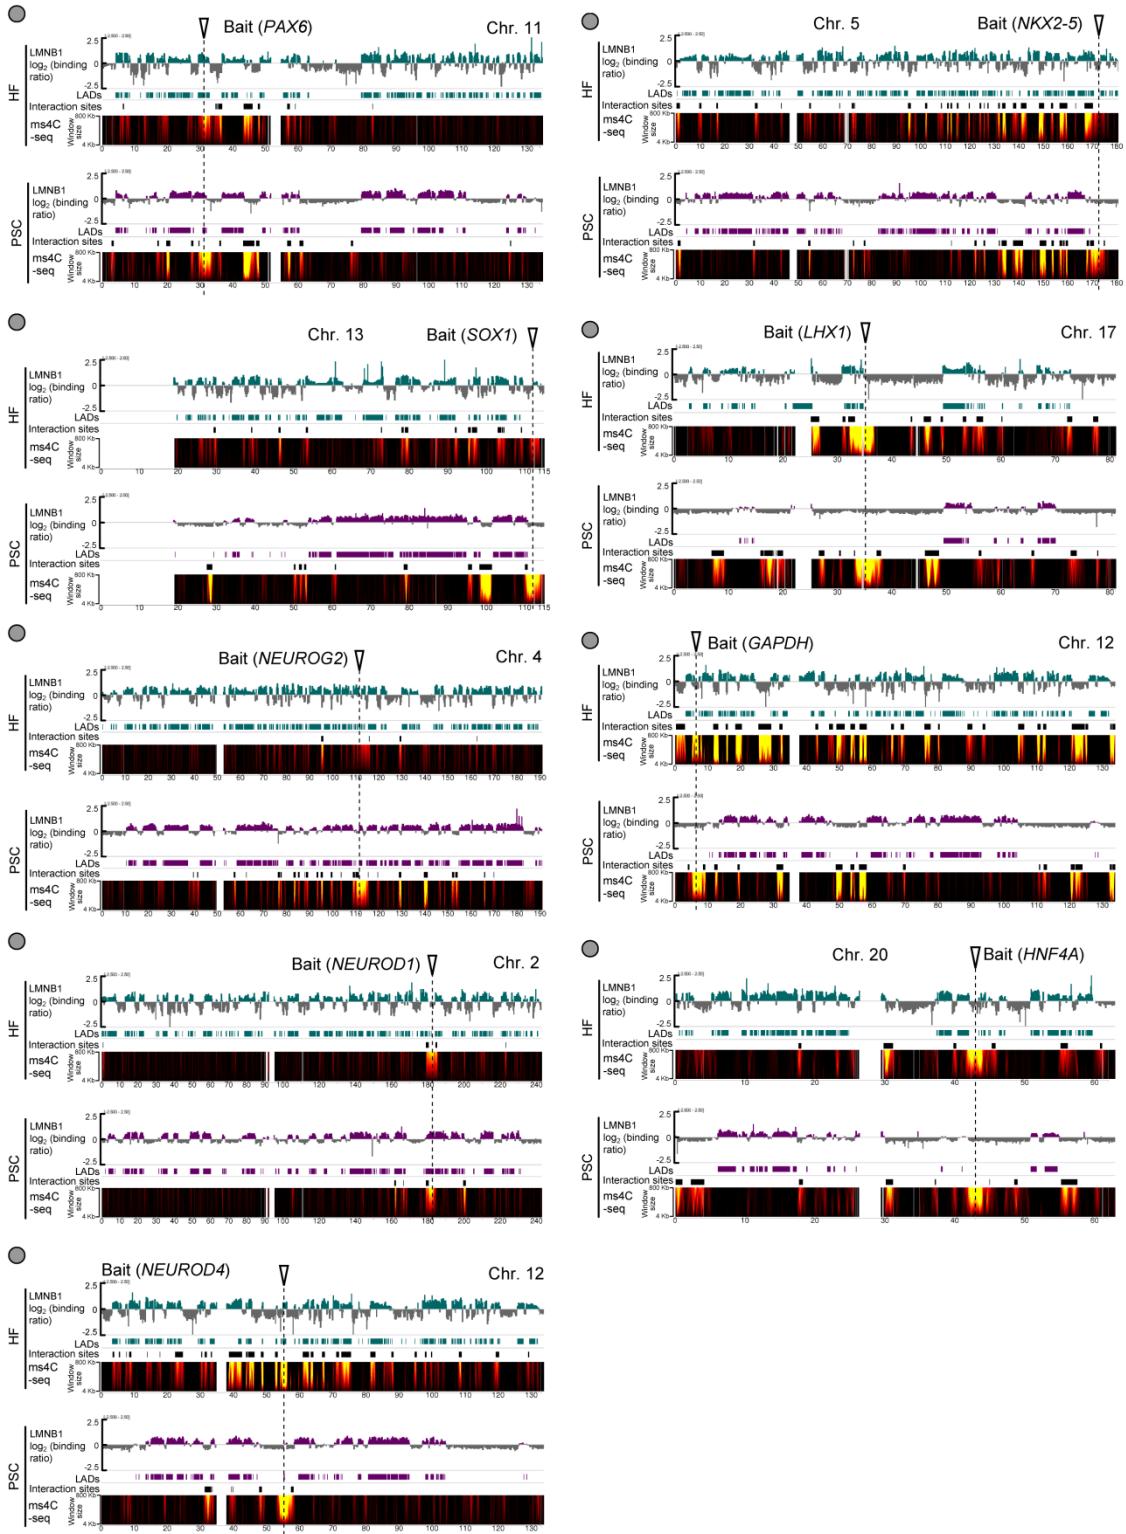

magenta and green. Scale bar, 5 μ m.

(c) Validation of the ms3C-seq data by 3C-qPCR. Top: Cis interaction frequencies of the *HOXA13* gene locus are presented with domainograms. The color scale is the same as shown in Fig. 1b. Middle: The bar plots show ms3C-seq read distributions in each HindIII site around the *HOXA* cluster locus in iPSCs and their original cells HFs (HDFs). The locations of primers that were used for 3C-qPCR are represented by interaction target loci (magenta arrows) and bait (black arrow). Bottom: Relative interaction frequencies between *HOXA13* and each *HOXA* locus were determined by 3C-qPCR in HFs (HDFs) and iPSCs ($n = 3$). Interaction frequency of the *ERCC3* region is a positive control. (Means \pm SD, t-test, * $p < 0.05$, ** $p < 0.001$).

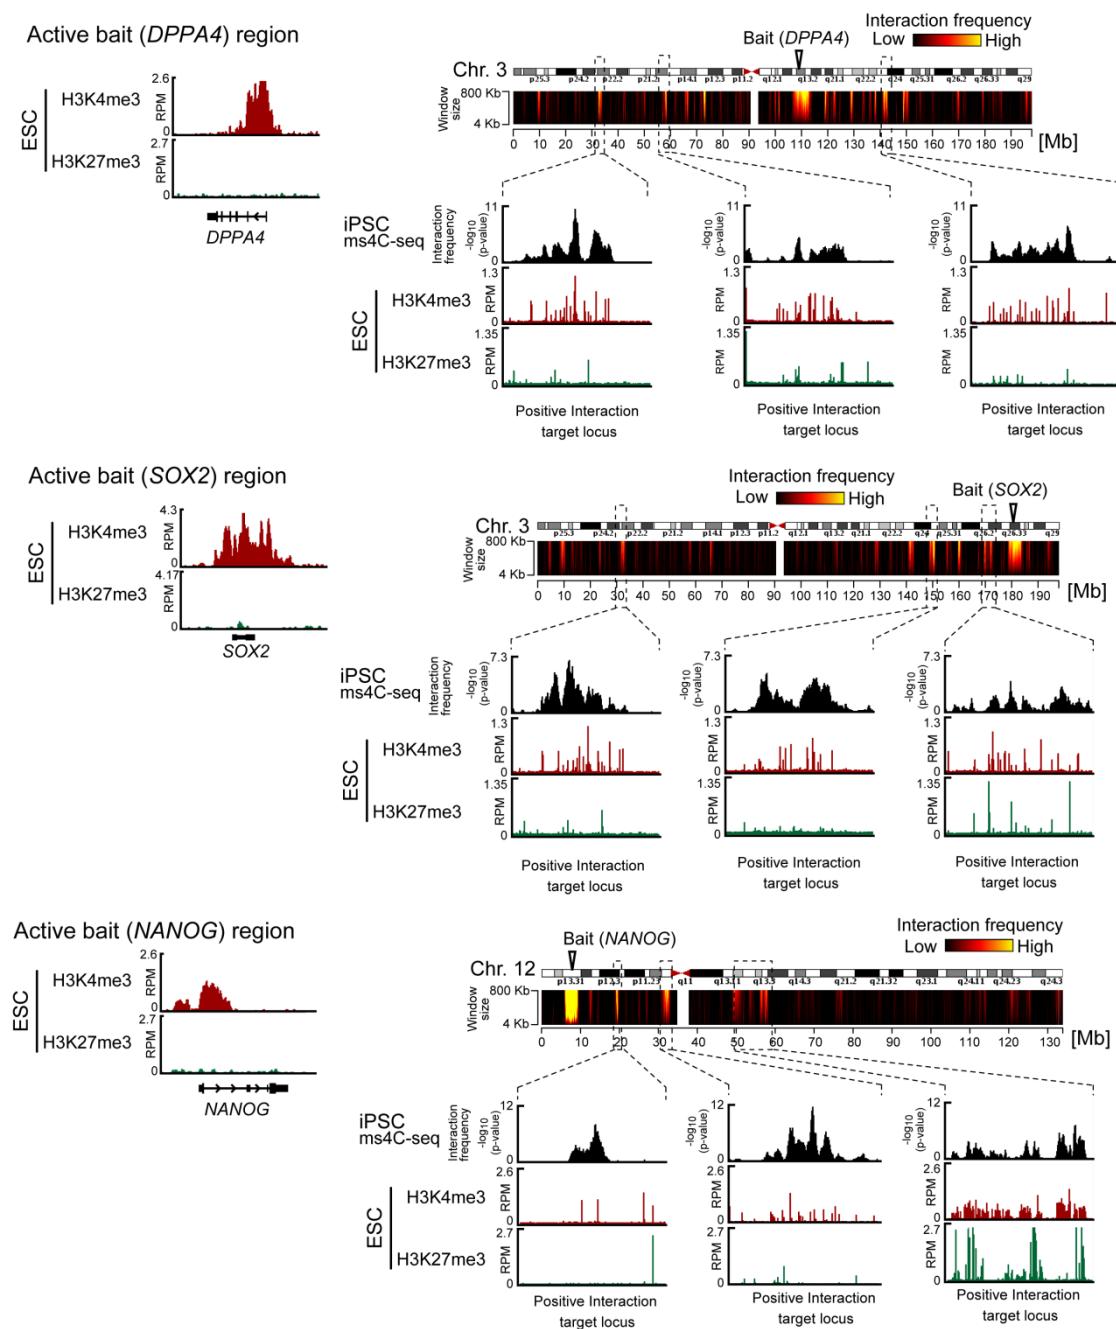

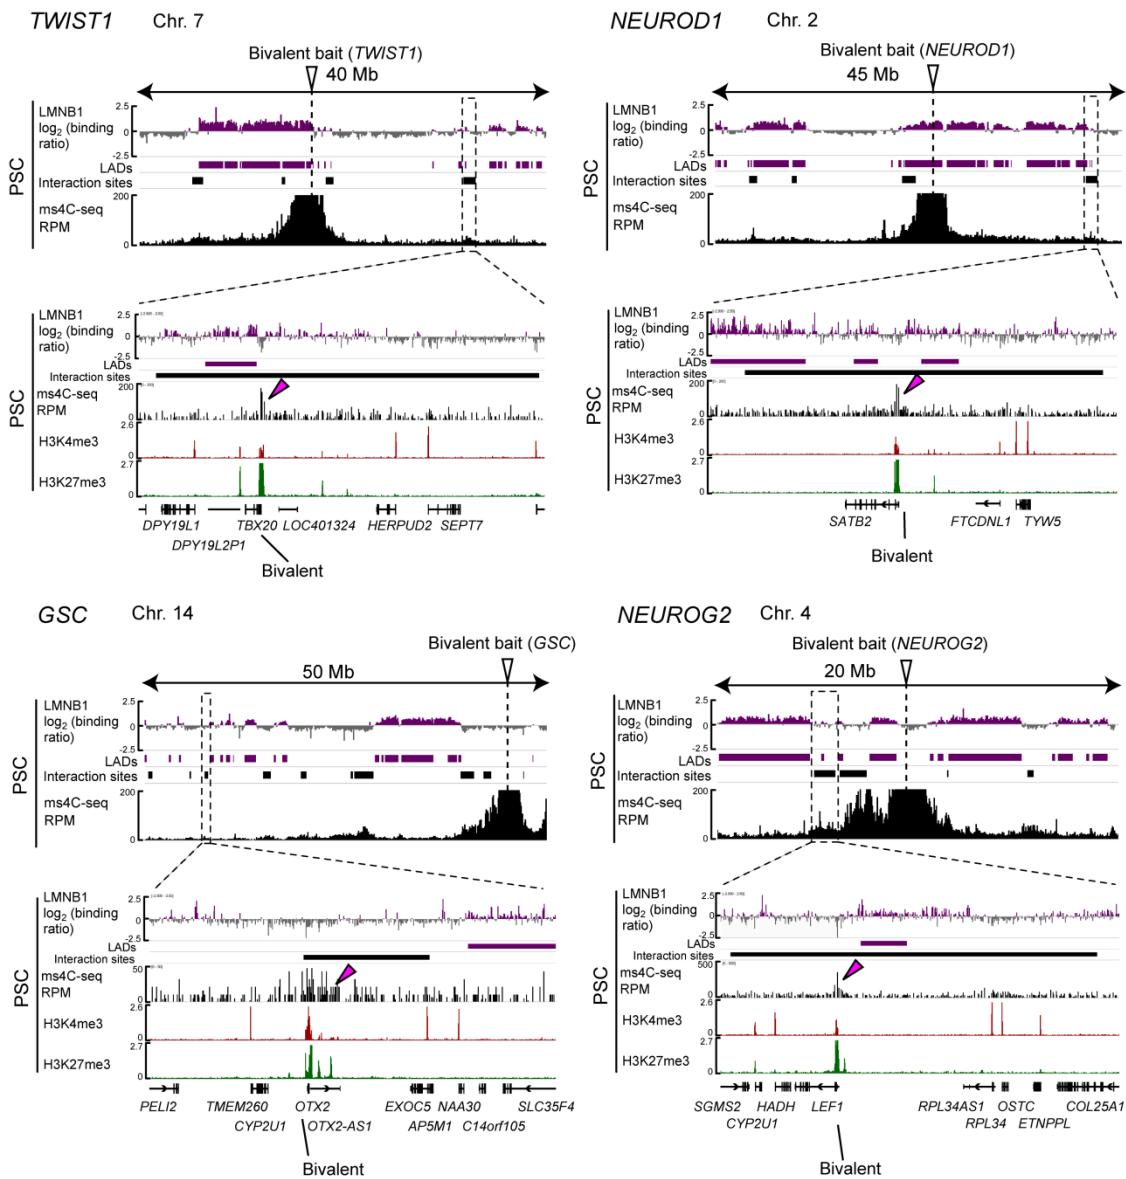

Supplementary Figure 3. LADs and chromatin interaction profiles in HFs and hPSCs

Relationship between chromatin interaction profiles and lamina association profiles at bivalent gene loci. The profiles are shown as described in Fig. 4d.

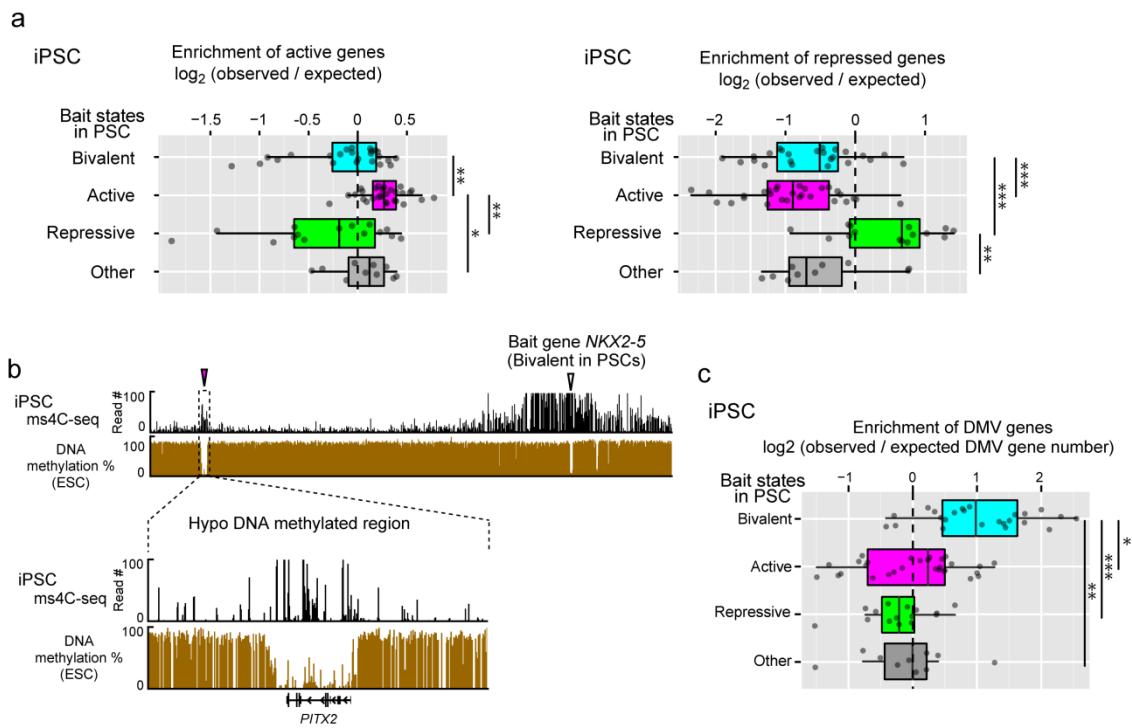

Supplementary Figure 4. Epigenetic states of the interaction target sites of the active gene locus

Histone modification patterns of H3K4me3 and H3K27me3 in the active gene loci (*NANOG*, *DPPA4* and *SOX2*) and their positive interaction target sites in hiPSCs. ChIP-seq data are represented by RPM signals for H3K4me3 (red) and H3K27me3 (green) in ESCs below ms3C-seq interaction signals in iPSCs (black).

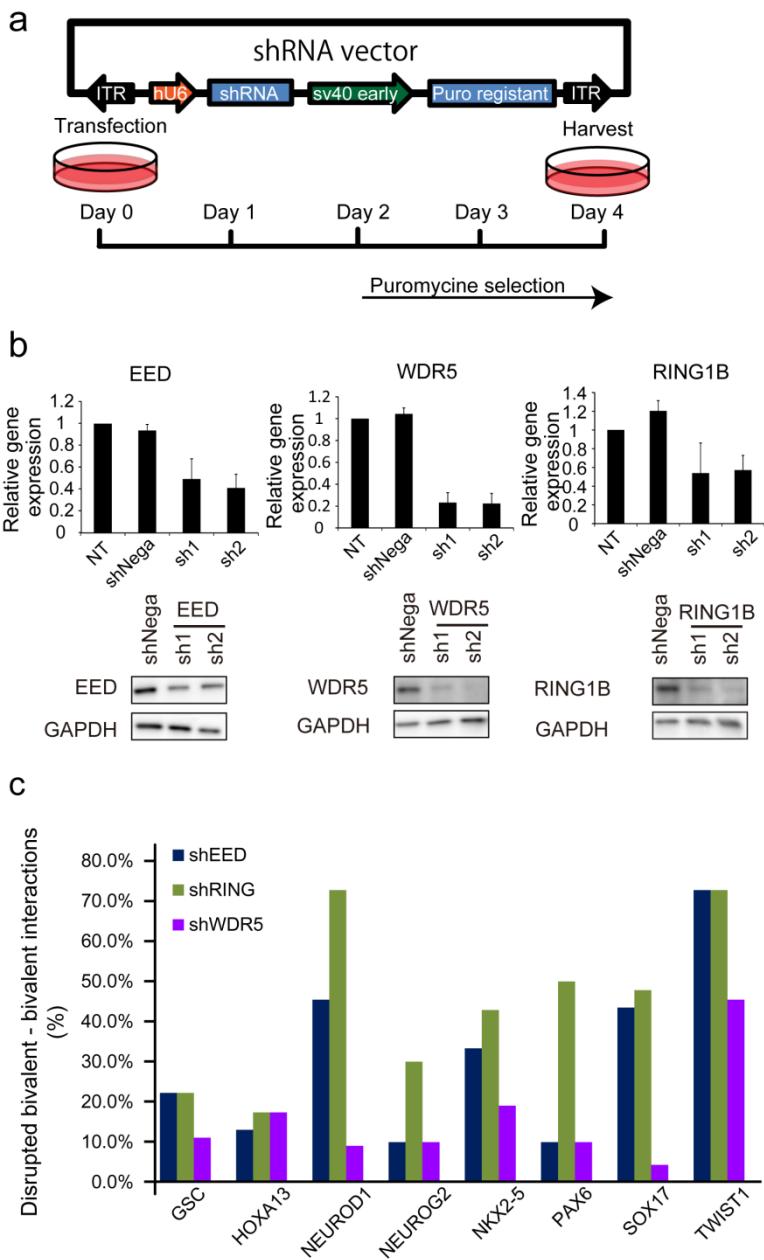

Supplementary Figure 5. Epigenetic states of the interaction target sites of the bivalent bait locus

LADs and histone modifications at interaction target sites of bivalent gene loci (*TWIST1*, *NEUROD1*, *GSC* and *NEUROG2*) in hPSCs. Lamina association signals in PSCs (ESCs) are shown as described in Fig. 2f. ChIP-seq data are represented by RPM signals for H3K4me3 (red) and H3K27me3 (green) in PSCs (ESCs) below ms3C-seq interaction signals in PSCs (iPSCs) (black).

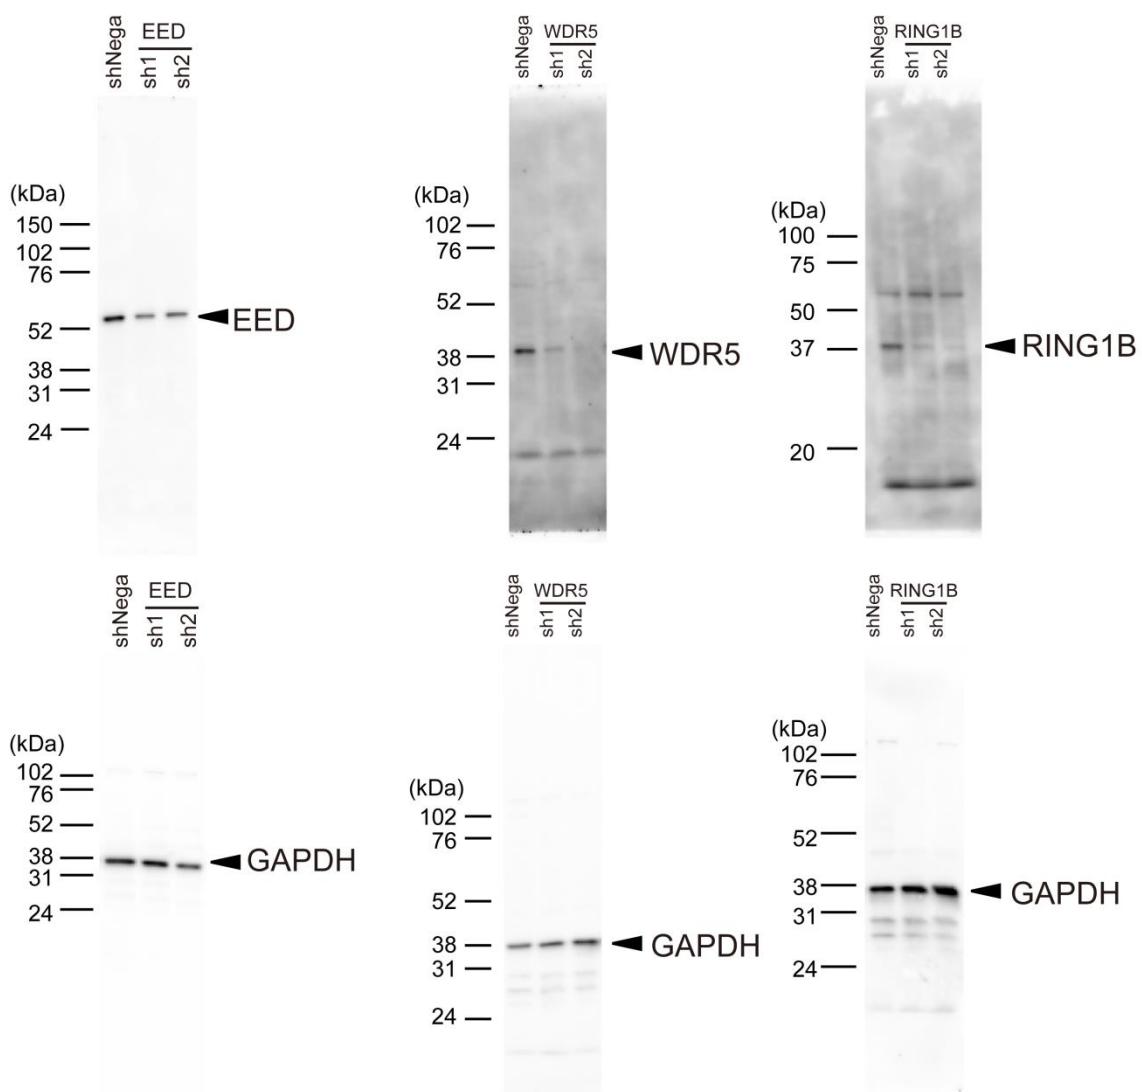

Supplementary Figure 6. Analysis of gene states in the interaction target genes of the bivalent bait locus

- (a) The enrichment of active and repressive genes in the interaction target genes of bivalent bait loci in iPSCs (428C2). Box plots show \log_2 (observed frequency for active (left panel) or repressive genes (right panel))/(expected frequency for active (left panel) or repressive genes (right panel)) in the interaction targets of bivalent, active, repressive and other bait gene loci (U-test, * $p < 5 \times 10^{-2}$, ** $p < 4 \times 10^{-3}$, *** $p < 3 \times 10^{-5}$).
- (b) Enrichment of ms3C-seq interaction signals in DNA methylation valleys in iPSCs. DNA methylation percentages at the interaction target sites of the bivalent gene (*NFKX2-5*) locus are shown under the ms3C-seq signals.
- (c) Enrichment of DMV genes in the interaction sites of bivalent genes in iPSCs (428C2). Box plots show \log_2 (observed frequency for DMV genes)/(expected frequency for DMV genes) in interaction targets of bivalent, active, repressive and other bait gene loci in PSCs (U-test, * $p < 1 \times 10^{-4}$, ** $p < 1 \times 10^{-5}$, *** $p < 1 \times 10^{-7}$).

Supplementary Figure 7. shRNA ms3C-seq analysis

- (a) Schematic diagram of knockdown experiments by shRNA.
- (b) Analysis of the knockdown efficiencies of each shRNA in hiPSCs by qPCR (upper panels) and immunoblotting (lower panels). Error bars indicate standard deviation ($n = 3$).
- (c) Percentages of bivalent genes with interaction signals that were reduced more than 30% in both independent shRNA knockdown experiments (sh1 and sh2) for EED, WDR5 and RING1B compared to shNega treatment in each bivalent bait.

Supplementary Figure 8. Full-length images of immunoblots in Supplementary Figure 7.

Supplementary Table 1. Primers and target sequences for shRNA
