## Supplementary Information

### Supplementary Figure S1: Rbpr2 mRNA expression patterns in staged zebrafish larvae

(A) Rbpr2 expression patterns were determined in staged zebrafish larvae by semi-quantitative RT-PCR. Total RNA from zebrafish larvae (1 - 5.5 dpf.) were subjected to semi-quantitative RT-PCR using zebrafish *rbpr2*, *stra6* and *gapdh* gene specific primers. Amplified PCR products were electrophoresed on 2 % agarose gels, alongside a low-molecular weight DNA ladder. Zebrafish *rbpR2* mRNA was observed as being expressed from early to late larvae stages. A portion of Zebrafish *stra6* was amplified and used as positive control. A portion of zebrafish *gapdh* was also amplified at same developmental time points and this served as the endogenous loading control.

### Supplementary Figure S2: Eye sections of zebrafish at 5 dpf from rescue experiments

Histological analysis of *rbpr2*<sup>musc97</sup> mutant larvae eyes after rescue experiments at 5 dpf showed normal retinal lamination and eye patterning which were comparable to WT animals.

### Supplementary Figure S3: ZIRC *rbpr2* mutants (*rbpr2*<sup>sa10706</sup>) show eye phenotypes consistent with retinol deficiency

A *rbpr2* mutant zebrafish line (G>A mutation; *rbpr2*<sup>sa10706</sup>) from the Zebrafish International Resource Center (ZIRC) which affects the essential splice site of exon

5/intron 6, was obtained and analyzed by light microscopy, histology and immunohistochemistry for cones at 5.5 dpf. The resulting eye phenotype observed was similar to the TALEN generated *rbpr2* mutant phenotype (*rbpr2<sup>musc97</sup>*) described. *Rbpr2<sup>sa10706</sup>* mutants showed gross defects, which included: \*hydrocephaly; \*\*smaller eyes, \*\*\*pericardial edema and \*\*\*\*slight tail curvature.

**Supplementary Figure 1**

*rbpr2<sup>musc97</sup> mut* + 150 ng mRNA

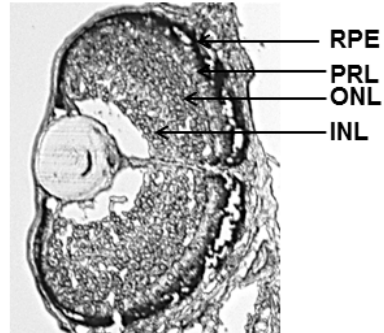

*rbpr2<sup>musc97</sup> mut* + 0.2  $\mu$ M ATRA

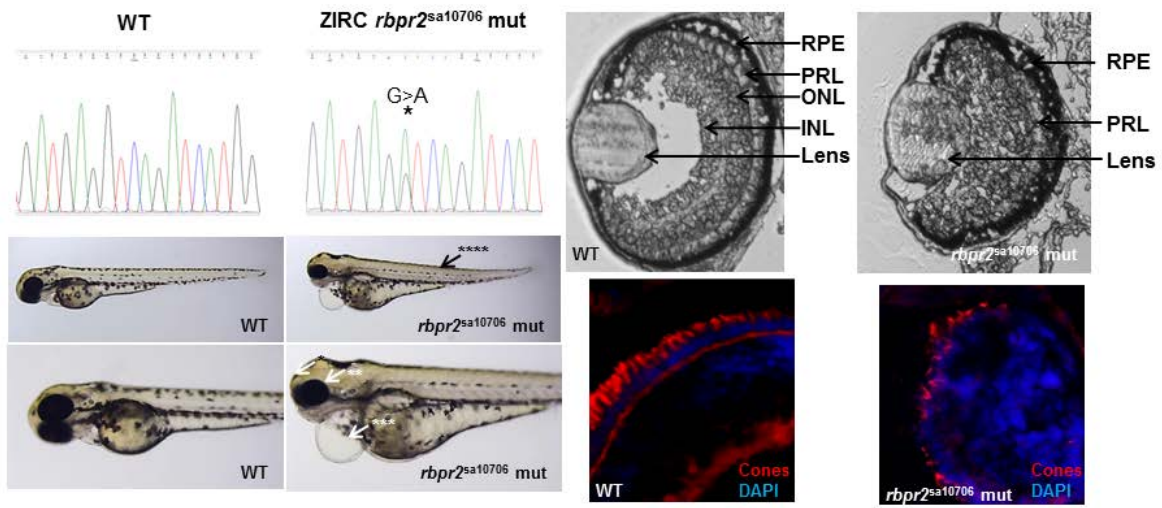

*rbpr2<sup>musc97</sup> mut* + 250 ng mRNA

*rbpr2<sup>musc97</sup> mut* + 0.5  $\mu$ M ATRA
