

Stabilization of α -Synuclein Fibril Clusters Prevents Fragmentation and Reduces Seeding Activity and Toxicity, Huy T. Lam, Michael C. Graber, Katherine A. Gentry, Jan Bieschke

Supplementary Figure 1

Supplementary Figure 1: α Syn samples (45 μ M) were incubated under constant shaking at 37°C for the indicated time intervals and then centrifuged at 70k RPM (205,000 x g) for 30 minutes. The supernatant was then analyzed by SDS-PAGE and stained by Coomassie brilliant blue. All α syn ran as monomer. Monomer band intensities were analyzed densitometrically.
