

Supplementary Figure 1. NP-718m-LNP treatment of viral isolates from survivor and non-survivor animals show comparable antiviral activity. HepG2 cells were infected with virus isolated from MARV-infected animals at 5 days post-infection and treated with either NP-718m-LNP or a non-targeting siRNA LNP negative control. Data are means \pm SEM of technical duplicates from one experiment. LLOQ = 1.17 log(pfu/mL).
