

Supplemental Figure 3. E. Bardel *et al.*

Supplemental Figure 3.

HIV gp140-specific IgA antibodies can be detected in cLN cells supernatants after the second ID immunization. Mice were immunized once or twice (2 weeks interval) with gp140+Poly(I:C) and gD-specific IgG and IgA were titrated in 3 day culture supernatants of cLN and mLN cells (10^6 /well) cultured without stimulation *in vitro*. Results are expressed as mean + SEM and derived from 6 determinations. Statistics were performed using unpaired *t* test with Welch's correction.
