

Phenotypic and clinical characterization of low density neutrophils in patients with advanced lung adenocarcinoma

Supplementary Materials

Supplementary Figure 1: Ratio of LDNs/HDNs and percentage of LDNs in PBMCs analyzed in malignant pleural effusion (MPE $n = 4$) and blood of lung adenocarcinoma (LA) patients, and blood of healthy controls (HC). LA patients include untreated and recurrent groups. Statistical significance was determined by a two-tailed Kruskal-Wallis test. $P < 0.01$.**
