1. Although automated anatomical labeling indicated that the cerebellum was part of this cluster, visual inspection suggested otherwise; i.e., some voxels were located in the cerebellum according to the AAL atlas, but seemed not to be part of this anatomical region when superimposed on the standard MNI brain.
2. Although the Brodmann atlas indicated that these Brodmann areas were part of the cluster, visual inspection suggested otherwise; i.e., some voxels were located at the edge of the region defined by the Brodmann atlas, however the edges of these Brodmann seemed to extend beyond the border of the actual anatomical region when superimposed on the standard MNI brain.
3. Visual inspection suggested that this cluster was located in the white matter. Hence, the cluster did not yield any brain area when subjected to automated anatomical labeling.

1. Although automated anatomical labeling indicated that the cerebellum was part of this cluster, visual inspection suggested otherwise; i.e., some voxels were located in the cerebellum according to the AAL atlas, but seemed not to be part of this anatomical region when superimposed on the standard MNI brain.
2. Although automated anatomical labeling indicated that the fusiform gyrus was part of this cluster, visual inspection suggested otherwise; i.e., some voxels were located in the fusiform gyrus according to the AAL atlas, but seemed not to be part of this anatomical region when superimposed on the standard MNI brain. Similarly, although Brodmann labeling indicated that Brodmann area 37 (corresponding to the fusiform gyrus) was part of the cluster, visual inspection again suggested otherwise.
3. Although the Brodmann atlas indicated that these Brodmann areas were part of the cluster, visual inspection suggested otherwise; i.e., some voxels were located at the edge of the region defined by the Brodmann atlas, however the edges of these Brodmann seemed to extend beyond the border of the actual anatomical region when superimposed on the standard MNI brain.
4. Visual inspection suggested that this cluster was located in the white matter. Hence, the cluster did not yield any brain area when subjected to automated anatomical labeling.
