Supplementary tables and figures:

Table S1. Summary of patient demographic and clinical characteristics.

Table S2. The number of biomarkers in each omic platform across cancer types.

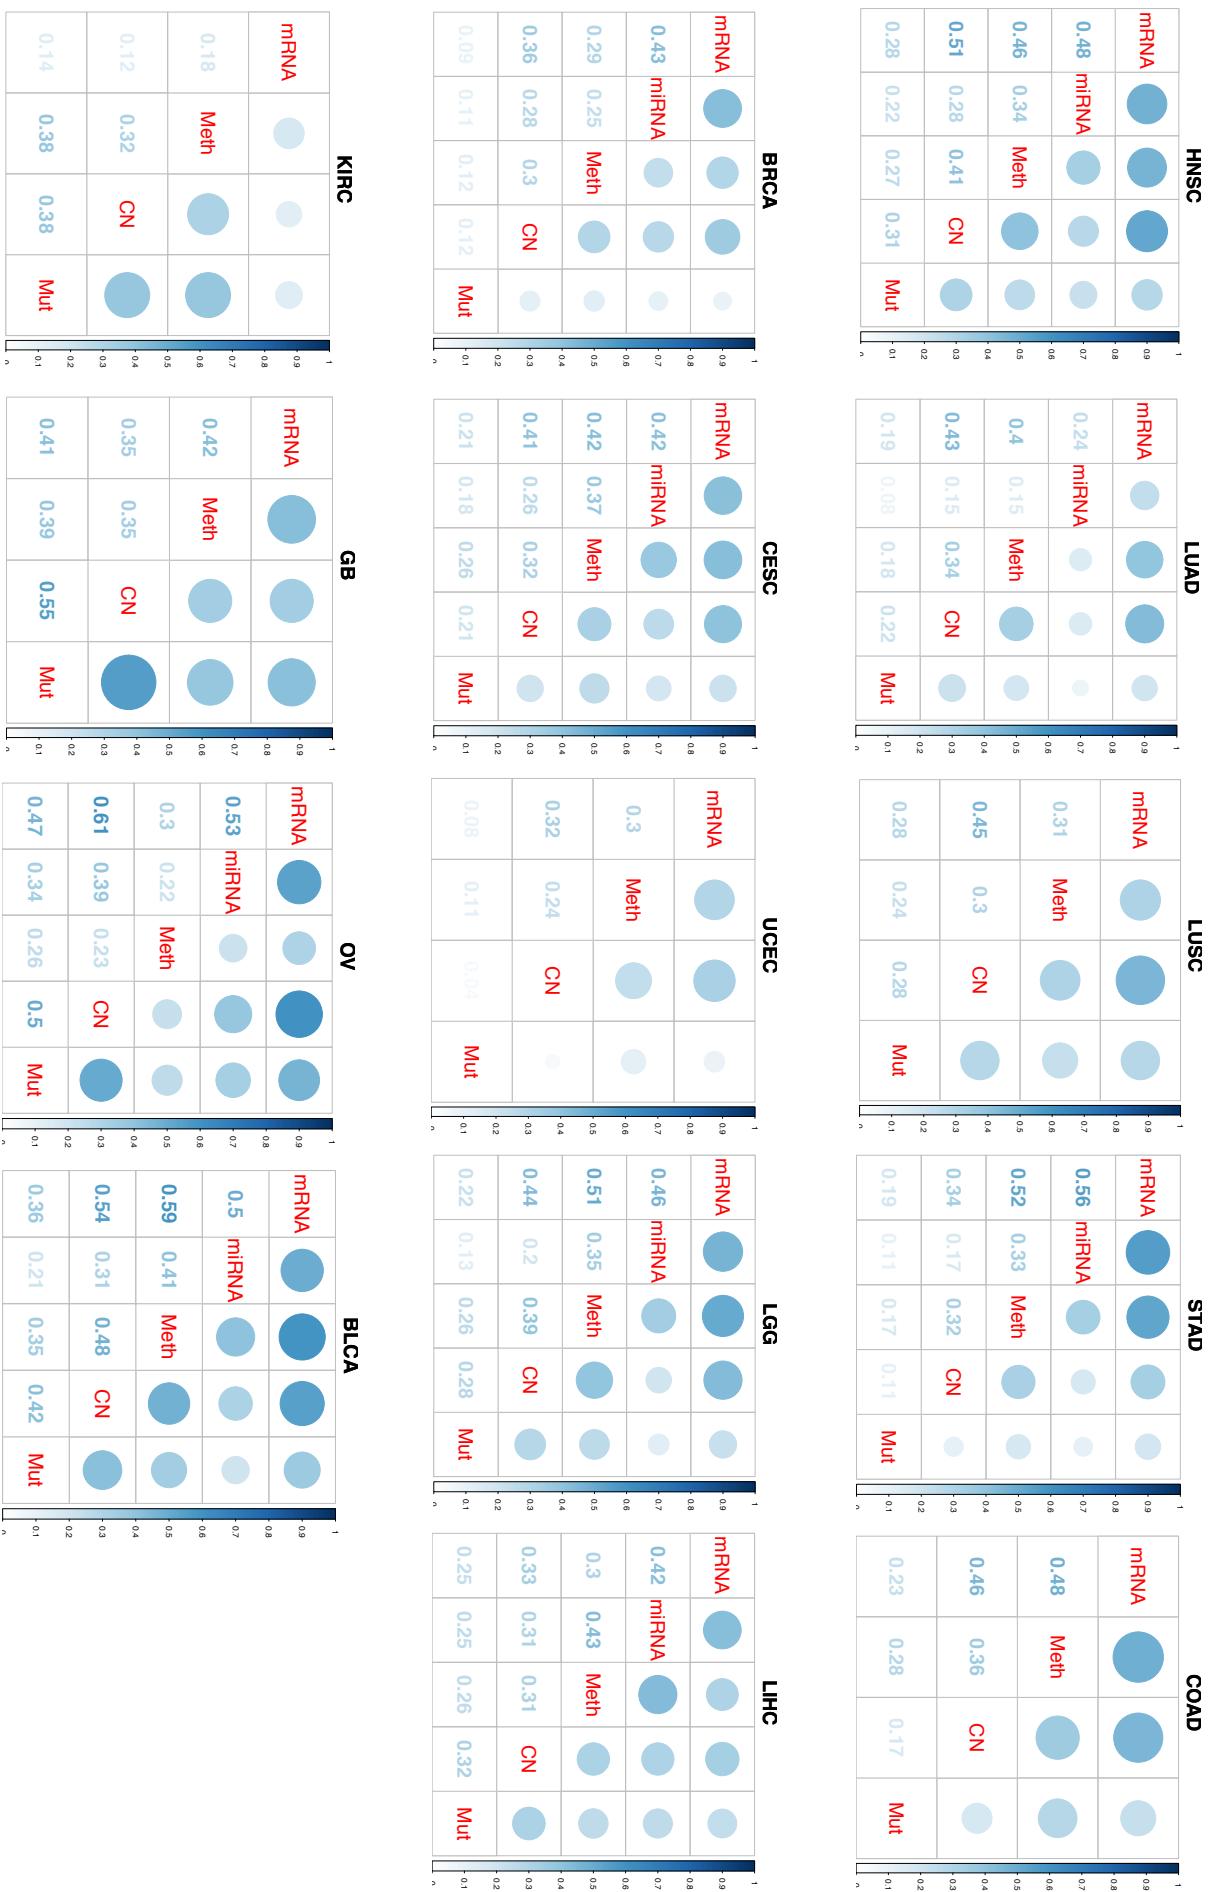

Figure S1. Pairwise kernel alignment among the five omic platforms (somatic mutation, copy number, methylation, mRNA and miRNA) in individual cancer types.

Figure S2. Pairwise Spearman correlation pattern in C-index between omic platforms.

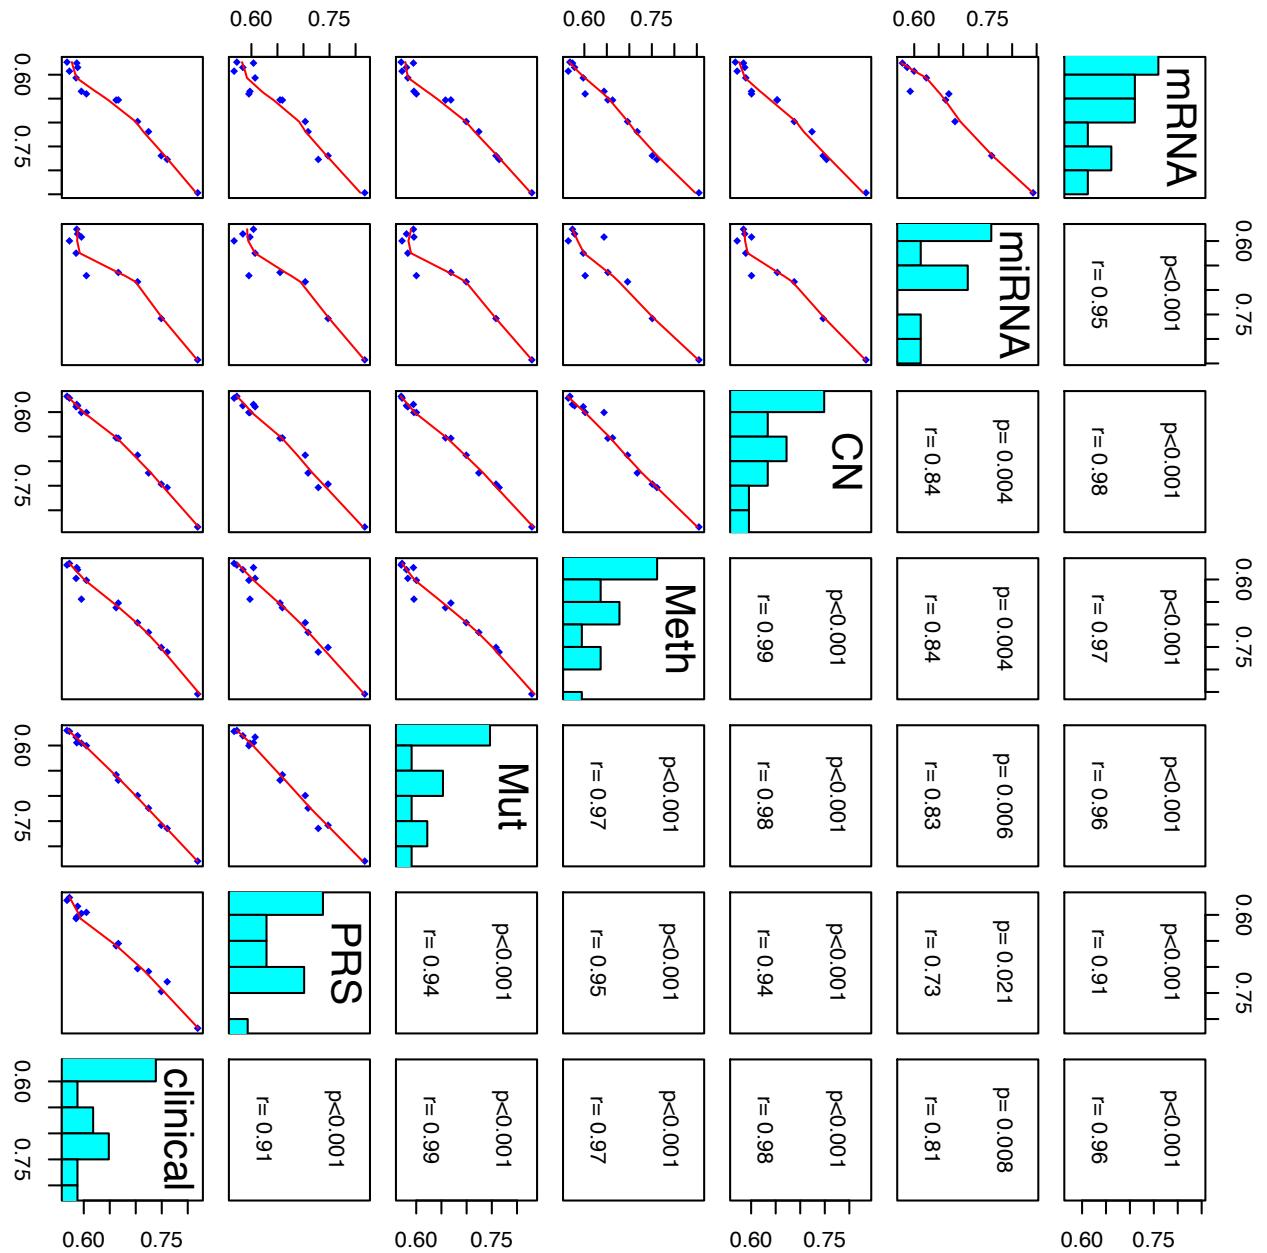

Figure S3. Radar plot of C-index for individual and combination of omic profiles in individual cancer types alone (red lines), or in combination with clinical variables (light blue lines). The C-index for clinical variables alone are plotted in dotted dark blue lines.

Figure S4. Boxplots of C-indices of protein expression for various across cancer types by kernel machine learning method and Lasso respectively.

Figure S5. Boxplots of C-indices of protein expression and mRNA across cancer types

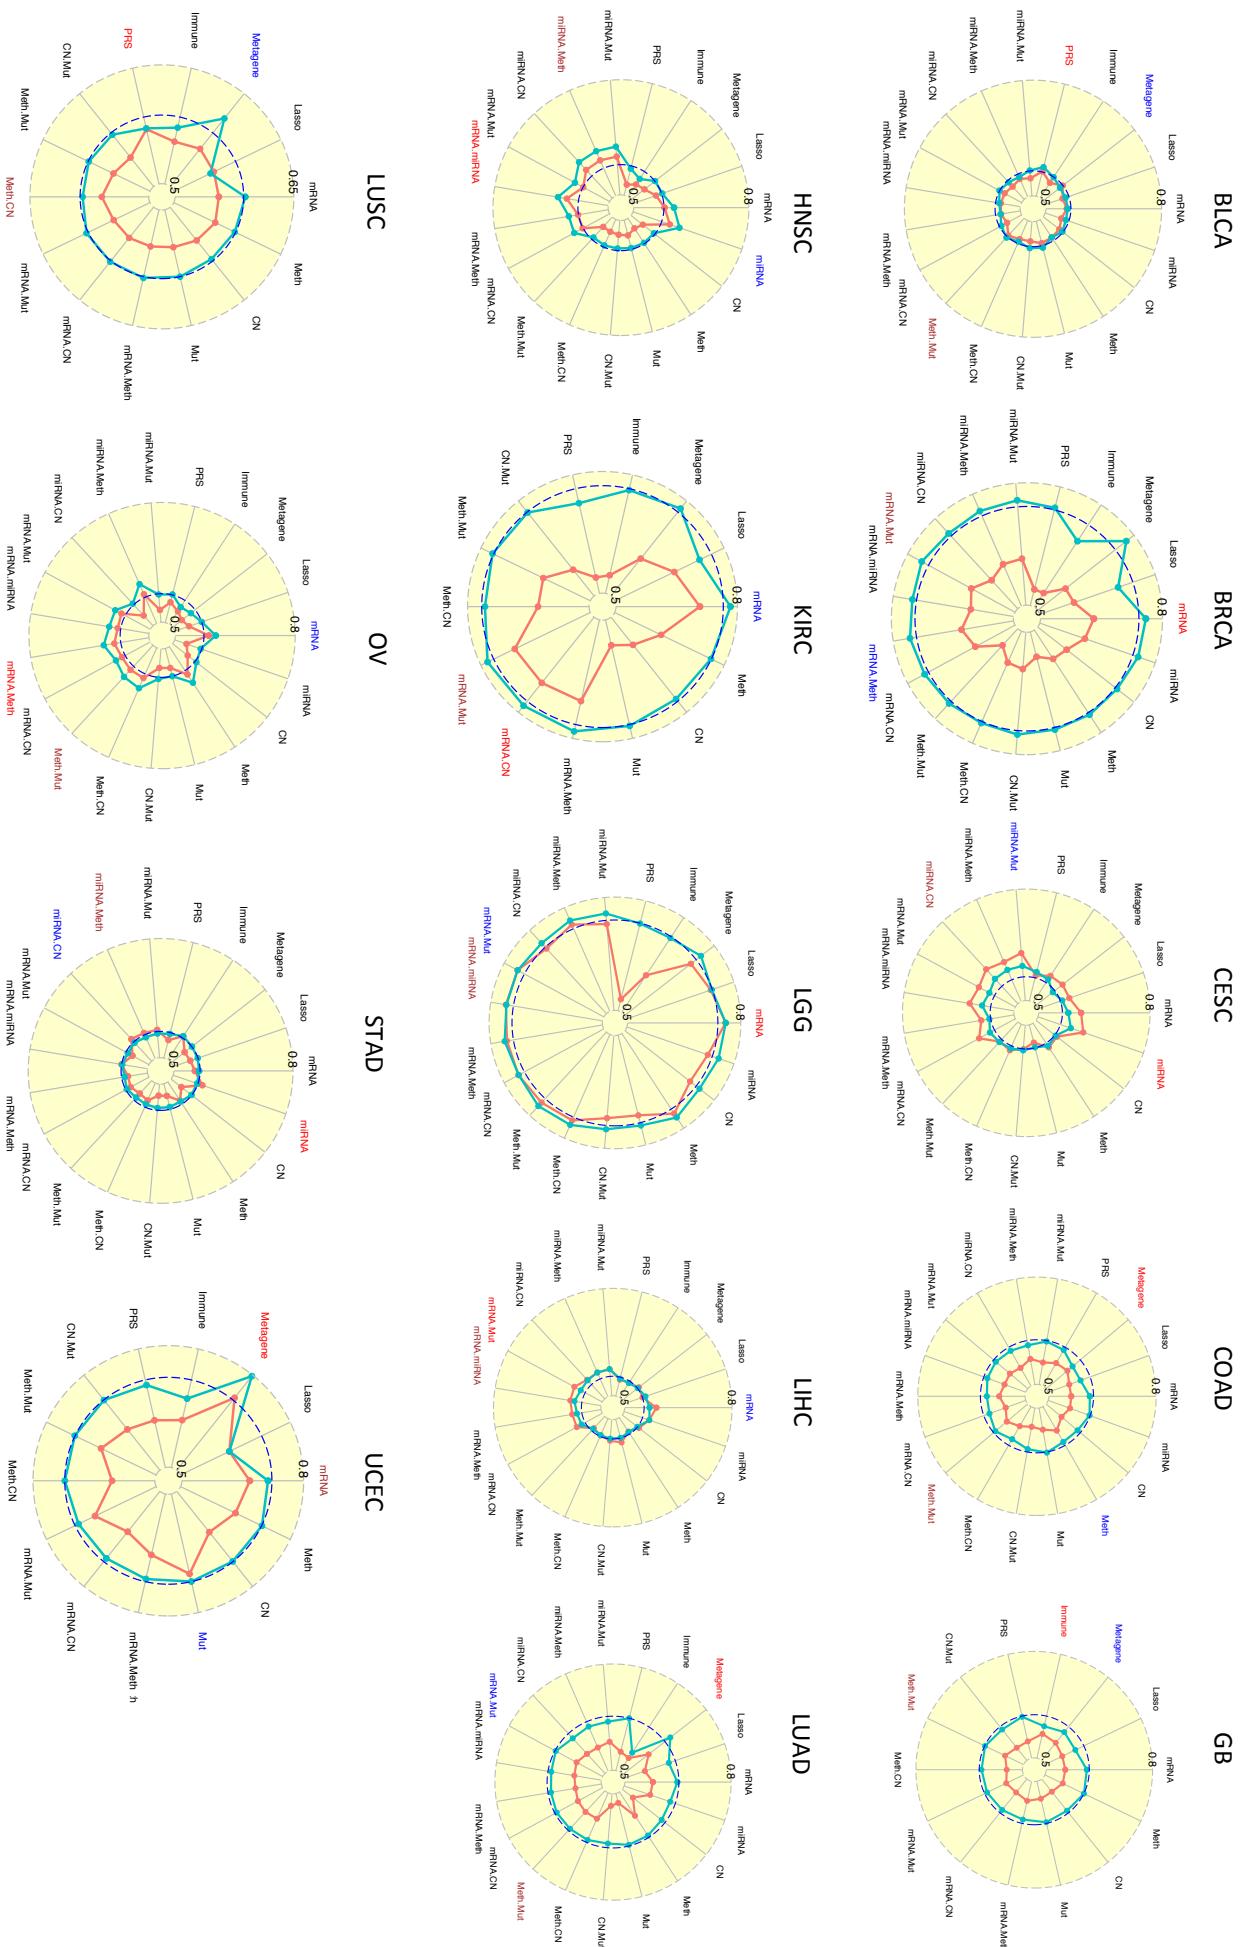

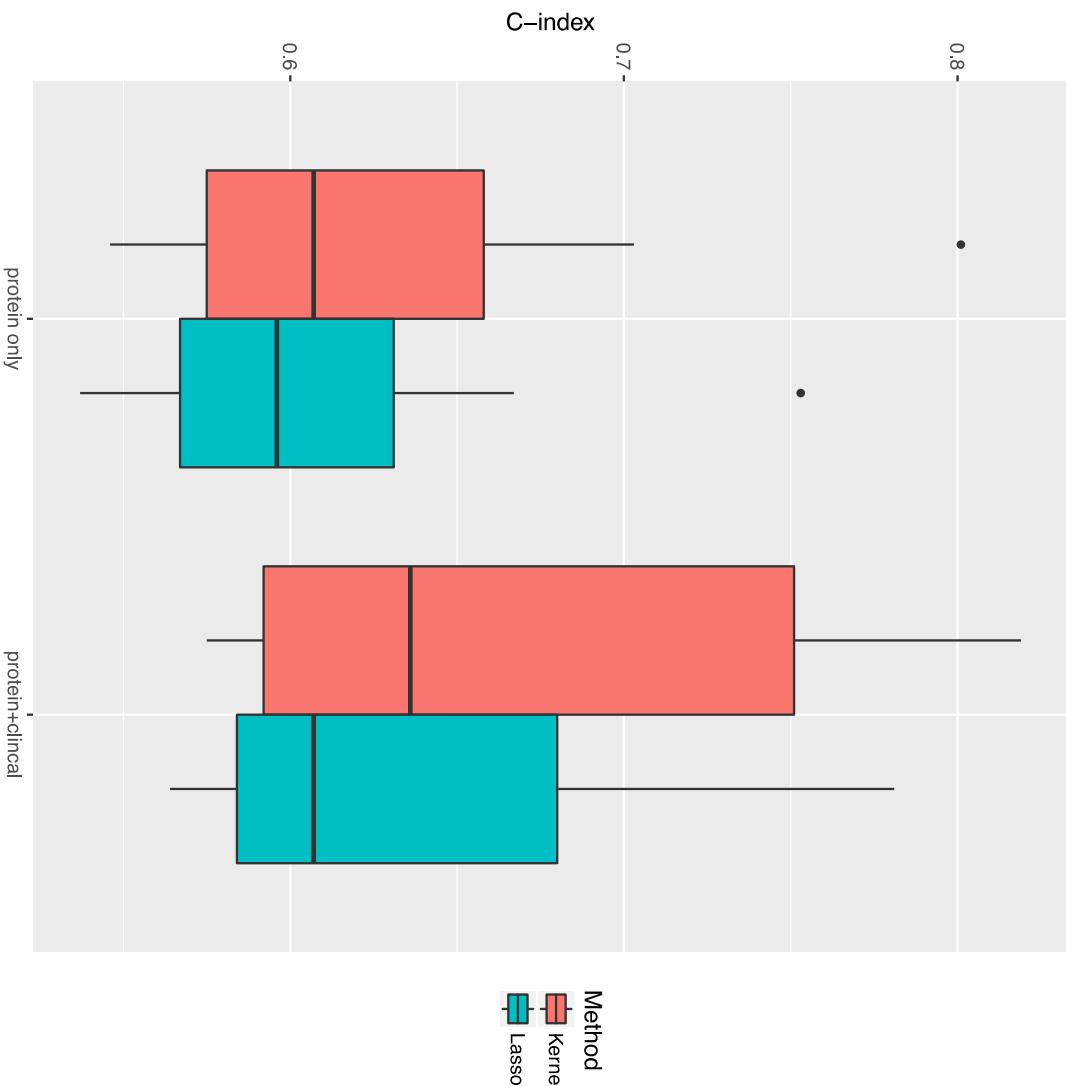

Supplementary Figure 1: Kernel alignment for each cancer type

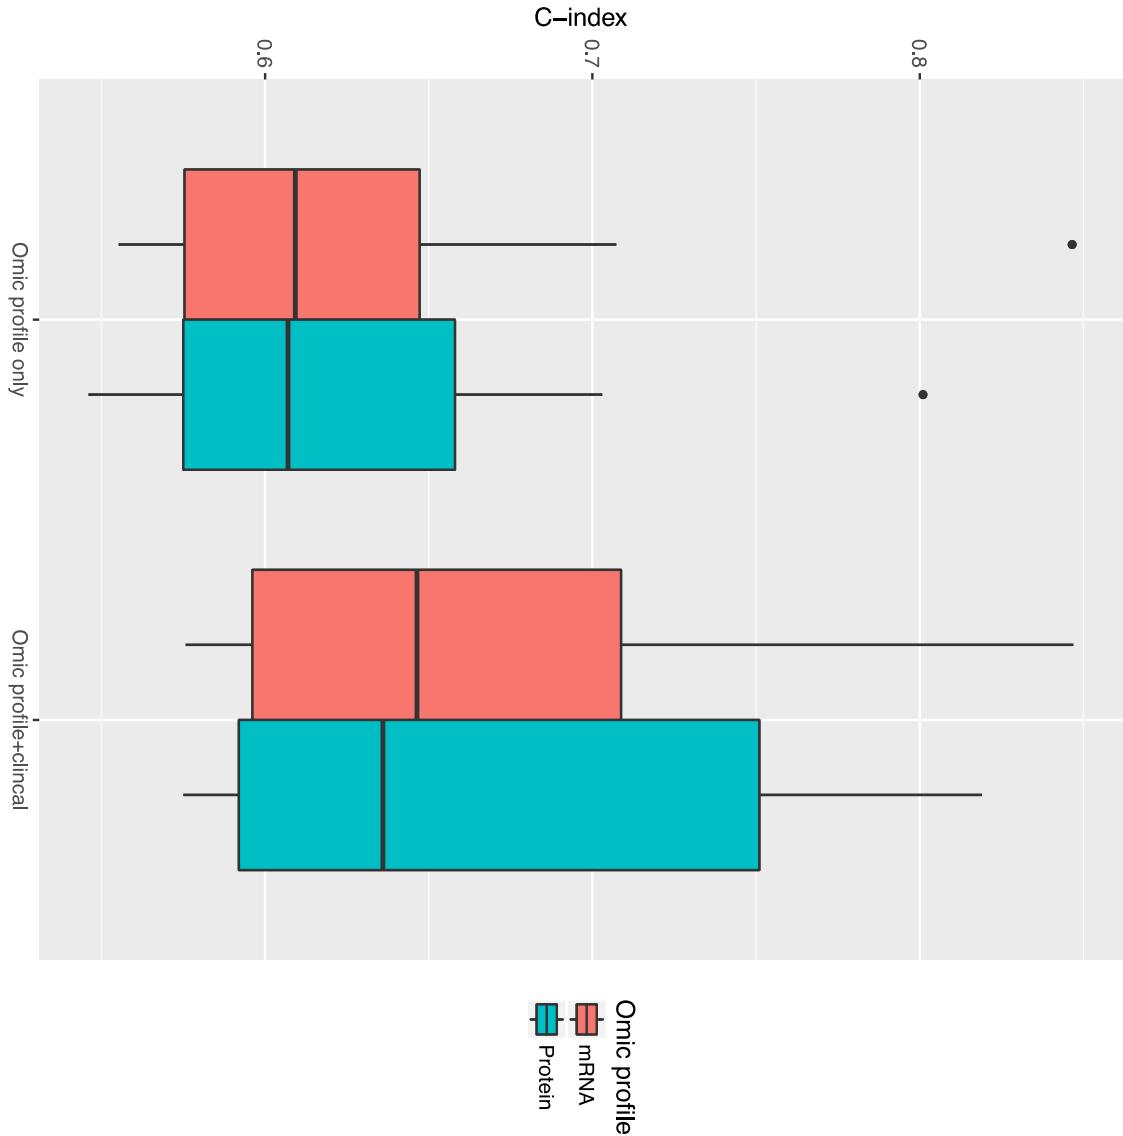

Supplementary Figure 2: Correlation plot
including clinical factors

Supplementary Figure 3: Radar plots

Supplementary Figure 4. Boxplots of C-indices of protein expression.

Supplementary Figure 5. Boxplots of C-indices of protein expression and mRNA

Supplementary Table 1

| Cancer | Total | Clinical information | Level | Counts |

N: Number of samples included in the analysis (with all four data types available)

CN: number of unique copy number regions. The number of regions vary across cancer type depending on the complexity of copy number landscape in each disease.

Meth: SNP and Sex chromosome probes were removed. KNN imputation was performed to impute missing value. Probes with greater than 20% missing were removed. Note that some of the disease types in earlier phase of TCGA including GBM, OV, KIRC, LUSC are 27K array data.

Mutation: list number of genes with at least one mutation observed in the cohort

mRNA: note RNA-seq data not available for GBM, Affy u133a array data was used for GBM
