

S1 Fig Low-dose mycobacterial infection led to similar bacterial loads in *Ncf1*^{-/-} and WT mice.

Ncf1^{-/-} and WT controls were intra-tracheal injected with *M. marinum* (3×10^6 CFU). The number of viable mycobacteria was determined at 7 days, 14 days and 28 days after *M. marinum* infection.

Data are shown as a mean log of CFU per paired-lung (5 mice per group).
