

Somech et al., 2017 Supplementary Information

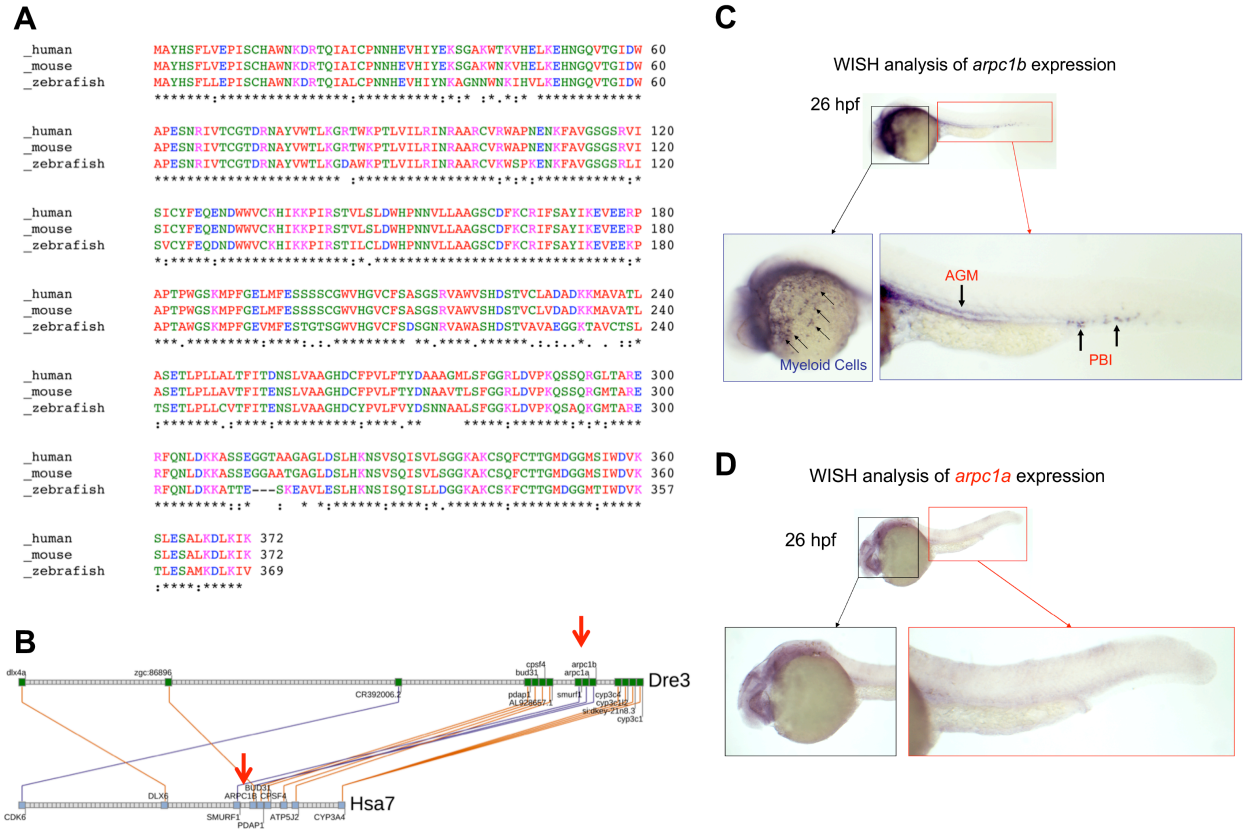

Disruption of thrombocyte and T lymphocyte development by a mutation in *ARPC1B*

Raz Somech^{1,2}, Atar Lev^{1,2}, Yu Nee Lee^{1,2}, Amos J Simon^{1,2,3}, Ortal Barel^{2,4}, Ginette Schiby⁵, Camila Avivi⁵, Iris Barshack⁵, Michele Rhodes⁷, Jiejing Yin⁷, Minshi Wang⁷, Yibin Yang⁷, Jennifer Rhodes⁷, Nufar Marcus⁸, Ben-Zion Garty⁸, Jerry Stein⁹, Ninette Amariglio^{2,3,4,6}, Gideon Rechavi^{2,4}, David L. Wiest^{7,10}, and Yong Zhang^{7,10}

A**TRB****B****TRG****C****IGH**

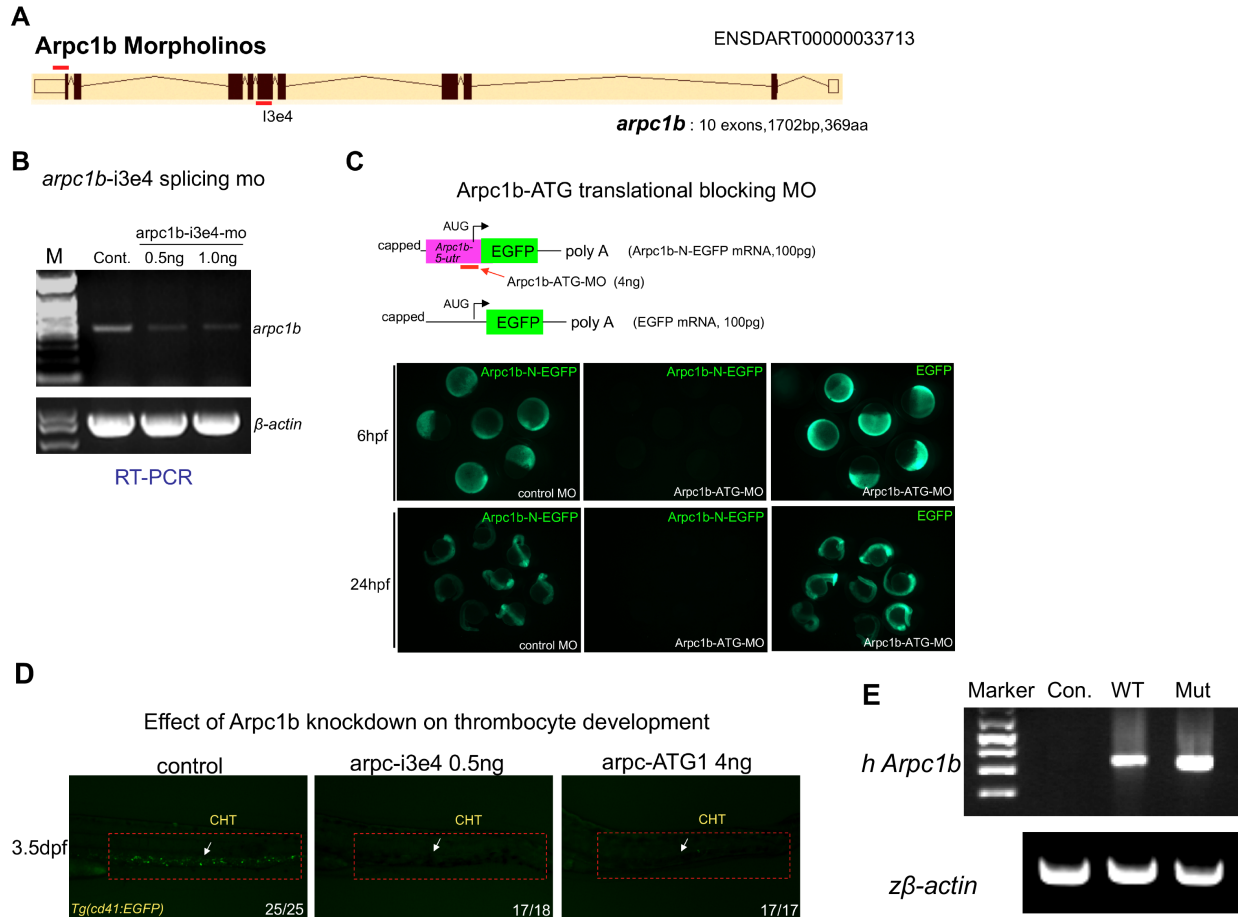

■ pt 1 ■ pt 2 ■ C (n=2, 4)

Supplementary Figure 1. Differential *VDJ* gene usage relative to the number of unique sequences in the patients' *TRB*, *TRG* and *IGH* repertoires. The frequencies of gene usages based on unique sequences for the patients for *TRBV* and *TRBJ* genes (A), *TRGV* and *TRGJ* genes (B) and *IGHV*, *IGHD* and *IGHJ* genes (C), are compared to the frequencies (average \pm SEM) of gene usage of two controls in *TRB* repertoire and four controls in *TRG* and *IGH* repertoires.

Supplementary Figure 2. WISH analysis of *arpc1b* and *arpc1a* expression in zebrafish hematopoietic system.

A, Amino acid sequence alignments of human, mouse and zebrafish *arpc1b*. * beneath the sequences indicates identity. *B*, Syntenic relationship between zebrafish *arpc1b* (on Dre.3) and human *ARPC1B* (on Hsa.7). Red arrows indicate that the *arpc1b* gene in zebrafish and the *ARPC1B* gene in humans are flanked by other syntenic orthologs. *C-D*, WISH analysis on 26hpf zebrafish embryo for *arpc1b* (**C**) and *arpc1a* (**D**). Lateral view with head to the left. Insets depict the blood cells in yolk (black arrows), AGM and PBI regions (bold black arrows). *Aprc1a* WISH exhibits staining in head and trunk areas but unlike that of *arpc1b*, it does not stain hematopoietic cells.

Supplementary Figure 3. Validation of *arpc1b* knockdown in zebrafish embryo.

A. Genomic structure of zebrafish *arpc1b* locus. Red lines mark the targeting sites of translation-blocking or splicing site MO. *B.* RT-PCR examination of endogenous *arpc1b* expression in control and *arpc1b* splice site MO injected embryos. β -actin serves as the internal loading control. *C.* EGFP reporter assay for functional validation of *arpc1b* ATG (translation-blocking) MO. *D.* Thrombocyte development was disrupted after *arpc1b* knockdown in 3.5dpf *Tg(cd41:EGFP)* transgenic embryos (red rectangles and white arrows). The embryos were photographed by lateral views. The numbers on the images refer to the fraction of embryos with the depicted phenotype. CHT: caudal hematopoietic tissue. *E.* The presence of the intact and mutant human *ARPC1B* mRNA employed to rescue development was verified by RT-PCR analysis at 3.5dpf.

Supplementary Table 1. Summary of the *V(D)J* gene usages in the total and unique sequences of TCR and BCR repertoires from patients and controls.

Supplementary Table 1. Summary of the *V(D)J* gene usages in the Total and Uniquesquences of T and B cell receptor repertoires from patients and controls.

The gene usages frequencies of the patients, and mean and two Standard Errors (SE) below or above the mean of the gene frequencies for the healthy controls (Mean \pm 2 x SE) are summarized and compared for the total and unique sequences of the T and B cell receptor repertoires. For each gene that are utilized either more or less than two SE above the mean of the controls were noted with either “+” or “-“ sign, respectively. The gene names (on the far right column) was colored in: green for genes that are higher in both patients; red for the genes that are higher in patient 1; and orange for the genes that are higher in patient 2.
