Supplemental Material

Time-Series Analysis of Heat Waves and Emergency Department

Visits in Atlanta, Georgia, 1993 to 2012

Tianqi Chen, Stefanie Ebel Sarnat, Andrew J. Grundstein, Andrea Winquist, and Howard H. Chang

Table of Contents

Table S1. The concordance-discordance between heat wave metrics in Atlanta, 1993-2012.

Table S2. Relative risk estimates and 95% confidence intervals of associations of heat wave days compared to non-heat wave days for emergency department visits for all 17 health outcomes.

Table S3. Relative risk estimates and 95% confidence interval for emergency department visits in relation to the order of heat wave day defined using maximum or minimum temperature.

Table S4. Relative risk estimates and 95% confidence interval for emergency department visits in relation to the order of heat wave periods within a year defined using maximum or minimum temperature.

Table S5. Relative risk estimates and 95% confidence interval for emergency department visits associated with per 1°C increase in average temperature during heat waves.

Figure S1. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 heat wave days compared to non-heat wave days, controlling for different continuous temperature metrics.

Figure S2. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 and lag 1 heat wave days compared to non-heat wave days, controlling for different continuous dew-point temperature and relative humidity metrics.

Table S1. The concordance-discordance between heat wave metrics during May to September in Atlanta, 1993-2012. Heat waves are defined as periods of ≥ 2 consecutive days with temperature (T) or apparent temperature (AT) exceeding the 98th percentile using daily maximum (MAX), minimum (MIN), or average (AVG). The first day of the heat wave period is considered a non-heat day.

Heat Wave Definitions	MAXT	MINT	AVGT	MAXAT	MINAT	AVGAT
MAXT		256	133	122	150	143
MINT	67 (26%)		251	259	232	245
AVGT	81 (61%)	104 (41%)		141	154	147
MAXAT	78 (64%)	82 (32%)	91 (65%)		154	139
MINAT	37 (25%)	96 (41%)	65 (42%)	51 (33%)		139
AVGAT	66 (46%)	105 (43%)	94 (64%)	88 (63%)	75 (54%)	

The upper triangular elements give the number of days where heat wave occurred using either metrics (union days). The lower triangular elements give the number of days where heat waves occurred using both metrics (intersection days). The concordance percentages are calculated by dividing the number of intersection days by the number of union days.

Table S2. Relative risk (RR) estimates and 95% confidence intervals (CI) of associations of heat wave days compared to non-heat wave days for ED visits during May to September in Atlanta, 1993-2012. Heat waves were defined as periods of ≥ 2 consecutive days with temperature (T) or apparent temperature (AT) exceeding the 98th percentile using daily maximum (MAX), minimum (MIN), or average (AVG). The first day of the heat wave period is considered a non-heat day.

Table S3. Relative risk (RR) estimates and 95% confidence interval (CI) for ED visits associated with different order of days within a heat wave period during May to September in Atlanta, 1993-2012. Heat waves are defined as periods of ≥ 2 consecutive days with temperature (T) or apparent temperature (AT) exceeding the 98th percentile using daily maximum (MAX), minimum (MIN), or average (AVG). The first day of the heat wave period is considered a non-heat day.

Table S5. Relative risk (RR) estimates and 95% confidence interval (CI) for ED visits associated with per °C increase in average temperature during heat waves during May to September in Atlanta, 1993-2012. Heat waves are defined as periods of ≥ 2 consecutive days with temperature (T) or apparent temperature (AT) exceeding the 98th percentile using daily maximum (MAX), minimum (MIN), or average (AVG). The first day of the heat wave period is considered a non-heat day.

Figure S1. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 heat wave days compared to non-heat wave days, controlling for different continuous temperature metrics. Heat waves were defined as periods of ≥ 2 consecutive days with daily maximum (MAX) or minimum (MIN) ambient temperature (T) or apparent temperature (AT) exceeding the 98th percentile. The first day of each heat wave period was considered a non-heat wave day. Estimates for heat wave and continuous temperature defined using the same metric (i.e. primary health model) are shown in blue.

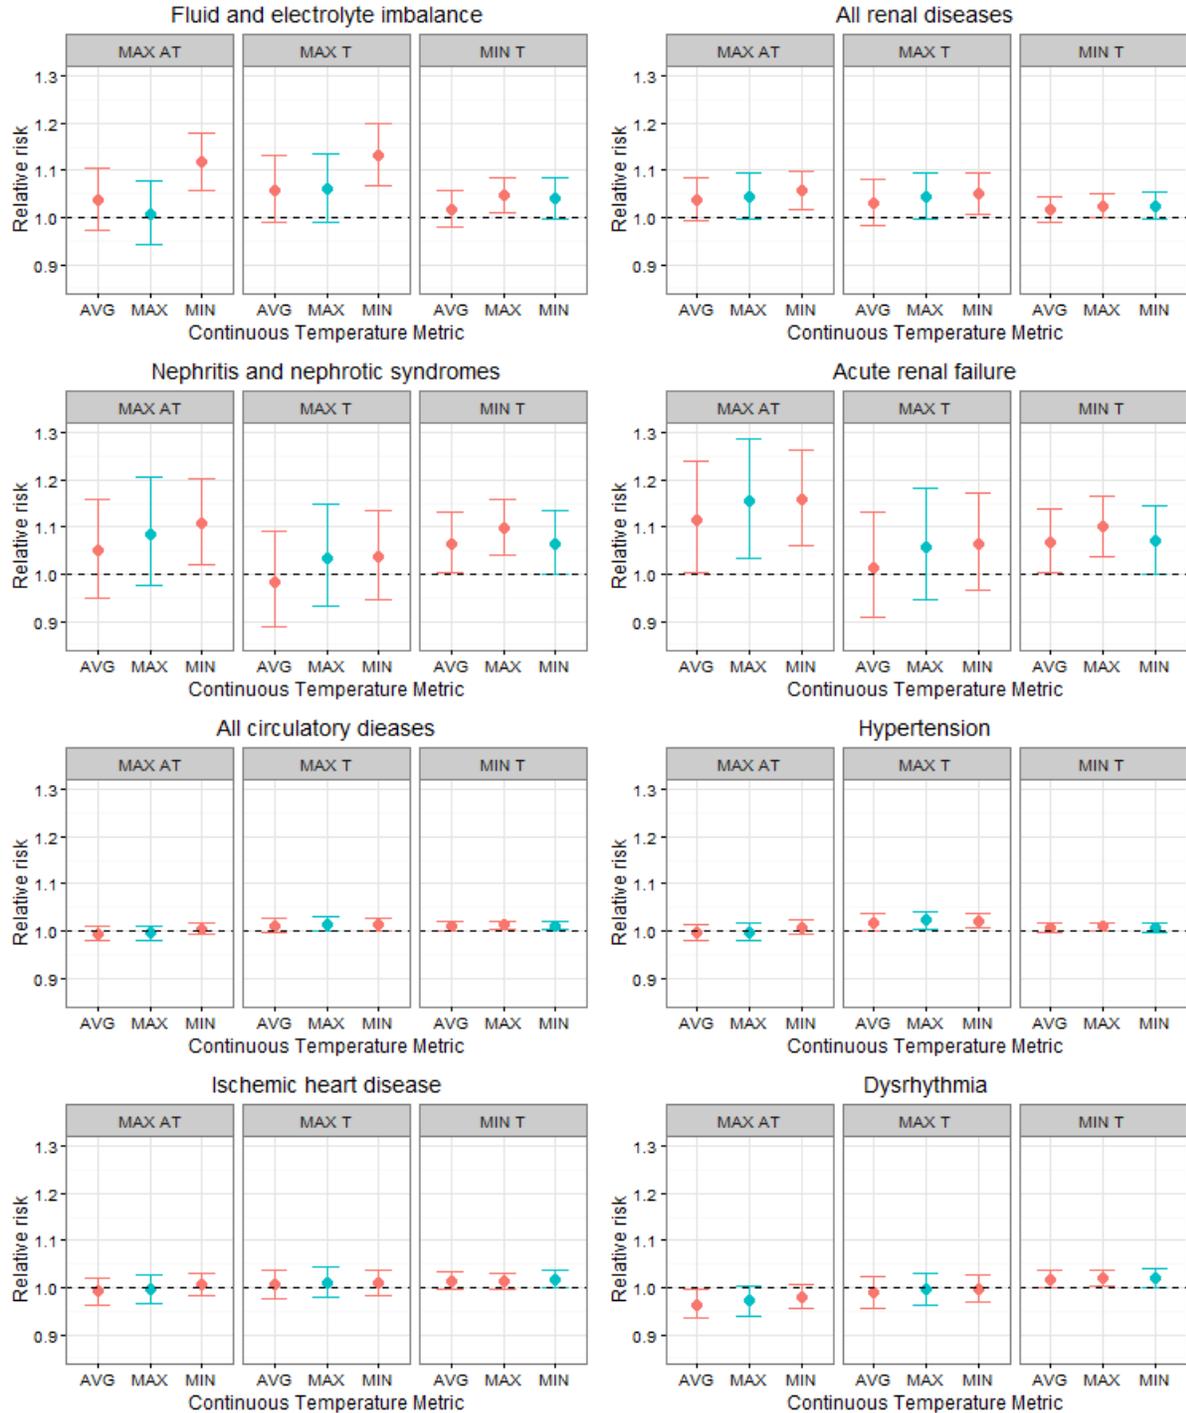

Figure S1 (Continued)

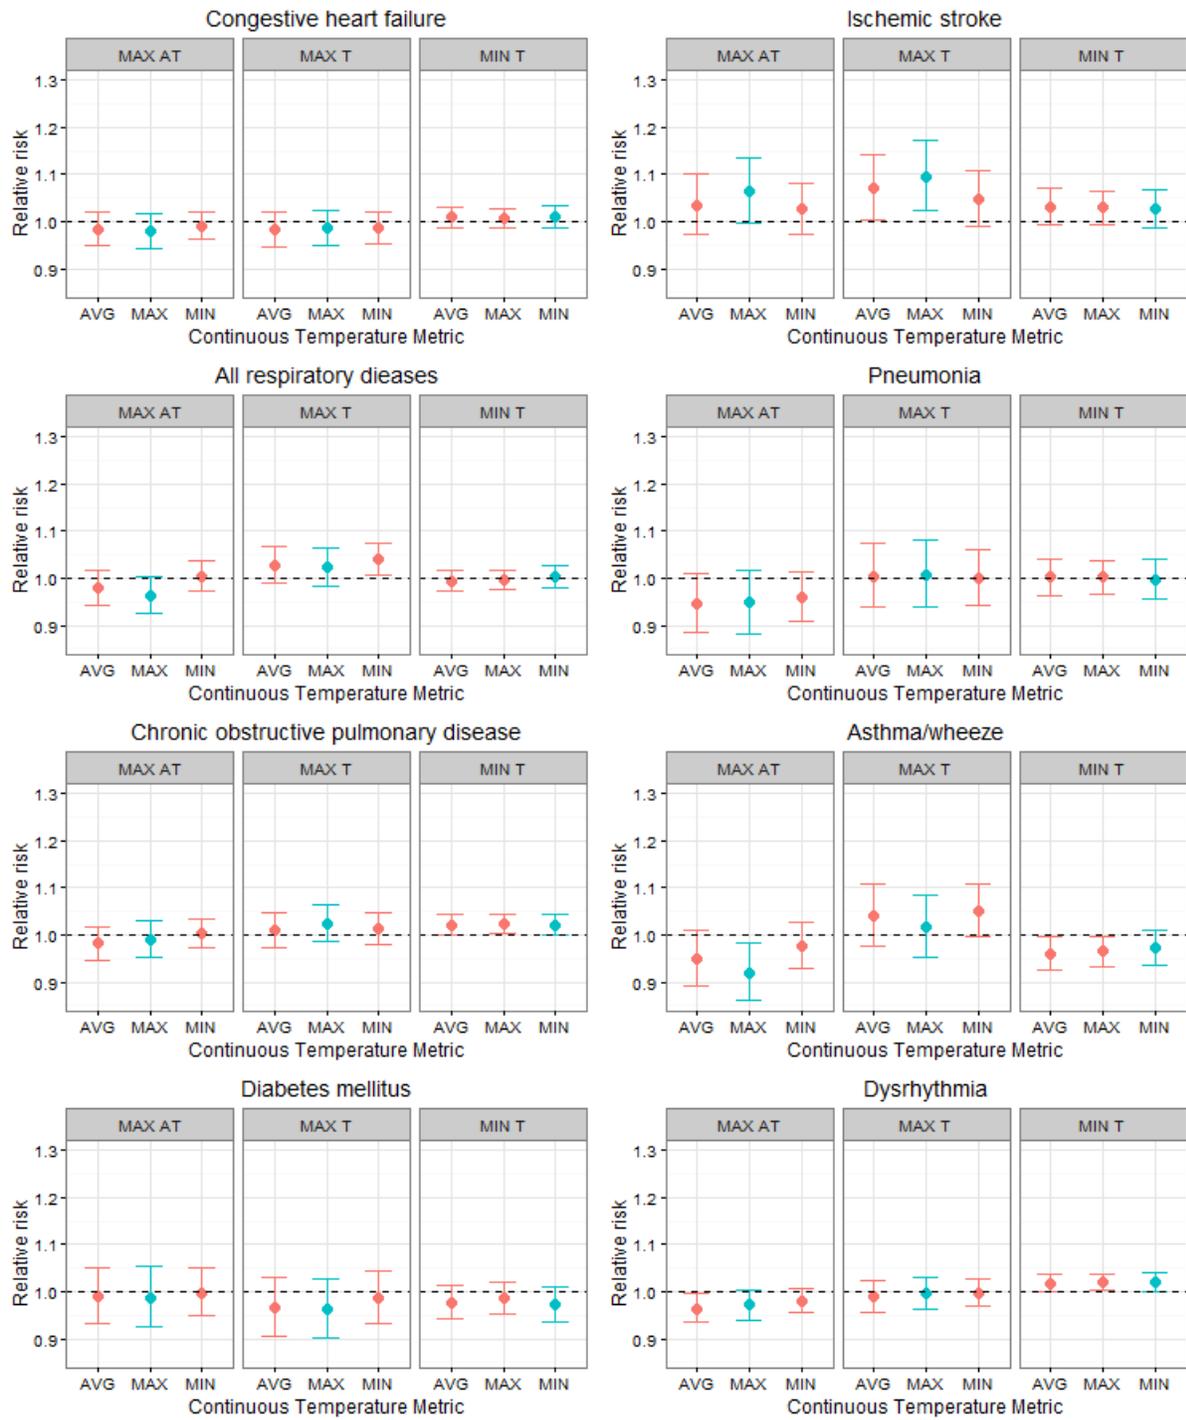

Figure S2. Estimated relative risks and 95% confidence intervals for ED visits associated with lag 0 and lag 1 heat wave days compared to non-heat wave days, controlling for different continuous dew-point temperature (DT) and relative humidity metrics (RH). Heat waves were defined as periods of ≥ 2 consecutive days with daily maximum (MAX) or minimum (MIN) ambient temperature (T) exceeding the 98th percentile. The first day of each heat wave period was considered a non-heat wave day. Estimates for heat wave and maximum dew-point temperature (i.e. primary health model) are shown in blue.
