

Supporting Information - S3 Fig.

Performance comparison of the reaching task (VMT group only).

The reaching performance was assessed with a two-way multiple comparisons ANOVA, with *Target position* (Ground vs. Air) and *Perspective* (1PP vs. 3PP vs. ALT) as the within subject variables. *Perspective* had no statistically significant effect on the time to reach targets ($F_{2,42} = 1.59, p > .21$), suggesting a similar performance across the three perspective conditions. The median time to reach across the reaching trials in a session was used as the performance measure.
