

Supplementary Figure S5. Gene-modified NK cell chimerism and VCN in the subset of animals assessed for clinical scores and survival, and LCMV quantification in the mice in survival studies. **(a)** Gene-modified NK cell chimerism (% tNGFR-expressing NK cells) and **(b)** VCN 12 weeks posttransplantation in mice used for clinical scores and survival experiments. Median copy number is listed above each group. **(c)** LCMV plaque-forming units (pfu) per 1×10^6 cells in bone marrow compared with on the day of sacrifice ($n=3$ experiments). Horizontal bars represent medians.
