

## SUPPLEMENTARY DATA

### The Application of miRTarBase in Others Database and Web tools

Table S2 lists the databases that incorporate miRTarBase which are categorized into six different groups 1) well-known databases; 2) information databases for MTIs; 3) MiRNA target prediction databases; 4) SNP or mutation related databases, 5) pathway related resources, and 6) others database or web tools. In category 1, the well-known databases, including miRBase (1), GeneCards (2), Ensembl (3) and Mouse Genome Database MGI (4) are kept which collect MTIs from miRTarBase as empirical evidence. TarBase (5) is included in category 2, and is considered to be another provider of complete MTIs. Furthermore, the empirical data in miRTarBase are also taken from validated criteria in relevant miRNA databases such as starBase (6), miRGator (7) and TSmiR (8), in terms of CLIP-seq data, gene expression profiles, and tissue specificity, respectively. In category 3, miRWalk2.0 documents the miRNA binding regions from existing target prediction programs to build comparative platforms of binding sites for the promoter, CDS and UTR regions. It also documents experimentally verified MTI information collected from miRTarBase (9). miRGate is a database of human, virus, mouse and rat MTI which is designed to analyze miRNA and gene isoform lists under a common and consistent set of annotations. Our database contains validated MTIs that were included in miRGate as experimentally validated data (10). mirMark is a tool based on machine learning method for miRNA target prediction at the site of UTR regions. The positive dataset used in mirMark is obtained from miRTarBase (11). With regard to the SNP or mutation related databases in category 4, PolymiRTS is a database of DNA variations in the miRNA seed regions of miRNA, as well as experimentally supported MTIs collected from miRecords and miRTarBase (12). SomamiR is a comprehensive database of somatic mutations in cancer from miRNA and target sites, which collects the MTIs from TarBase, miRecords and miRTarBase (13). miRTarBase has been incorporated into an increasing number of biological resources for pathway- and gene regulatory network related resources, such as miRPathDB (14), DIANA-miRPath (15), miRNet (16), and associations of miRNA related

disease, regulatory circuits, and cancer, such as HMDD (17), MAGIA2 (18), NCG (19), which are categorized in group 5 and 6. In brief, miRTarBase performs a significant role in providing validated experimental data. We believe the release of new version will provide great support in updating the databases mentioned above.

## SUPPLEMENTARY FIGURES

**Figure S1. The growth of miRNA and it's publication.**

The amount of miRNAs collected in miRBase, miRNA publications, and miRNA-target interaction publication collected in PubMed since 2002.

SUPPLEMENTARY TABLES

**Table S1.** Update MTI datasets validated by high throughput HITS-CLIP or PAR-CLIP sequencing
