

Supplementary Figure 3. Age Differences in Within-Group Partition Similarity. Within-group partition similarity for YA was higher, whereas for OA was lower, than expected based on the permuted data, at both time points, and for most of the threshold range. NMI, normalized mutual information; t_1 , time point 1 (top panel); t_2 , time point 2 (bottom panel); YA, younger adults (blue color); OA, older adults (red color). Color asterisks indicate $p < 0.05$ for each threshold.
