## Supplementary Figure 1 Legend

**Supplementary Fig.1**: Plot comparing the before and after peak VO<sub>2</sub> values in patients in the control group and in the exercise (HET) group. Patients in the control group did not show changes in their peak VO<sub>2</sub>. In patients in the HET group, higher baseline peak VO<sub>2</sub> values were associated with higher chances of improvement in peak VO<sub>2</sub> at the end of the study (regression lines represent a linear regression model, in which the predictor, baseline peak VO<sub>2</sub>, was modelled with cubic splines with 2 knots; grey bands represent the 95% CIs of the predictions).
