

S6 Figure. *uxt1Δ uxt2Δ* is severely attenuated for virulence in C57BL/6 mice.

Survival of C57BL/6 mice after intranasal inoculation with 5×10^4 cells of WT (n = 5) or *uxt1Δ uxt2Δ* (n = 19). C57BL/6 mice naturally skew towards a non-protective Th2-type response, which increases their susceptibility to cryptococcal infection compared to A/JCr mice [57].
