

Supplemental Figure 1. Comparison of effects of trabodenoson with and without preservative on IOP of young mice. Two cohort mice were treated with either 6% trabodenoson with preservative on one eye (OD), placebo on the contralateral eye (OS) or 6% trabodenoson with preservative-free on one eye (OD) and placebo on the contralateral eye (OS) once/day for seven consecutive days. The data are displayed as change (Δ) in IOP between treated and contralateral eyes (N = 8 for both cohorts).
