Supplementary figure 3: Sequences of probes used for EMSA. Red colour indicates *cis*-element and blue colour indicates substitution in *cis*-element.

Supplementary figure 4

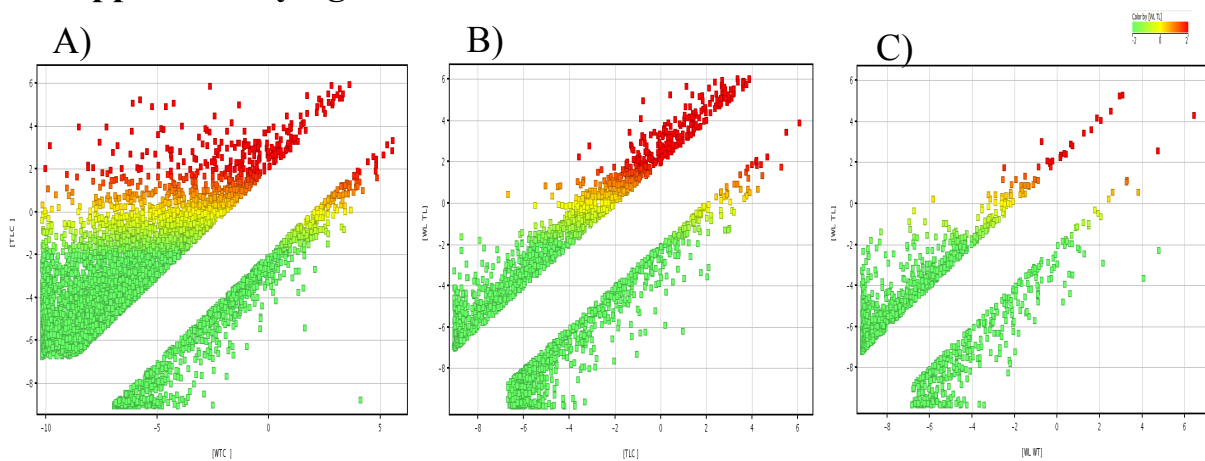

Supplementary figure 4: Transactivation/ β -Galactosidase colony lift assay in which MaRAP2-4-GAL4-DBD activates target gene LacZ to produce blue colour.

Supplementary figure 5

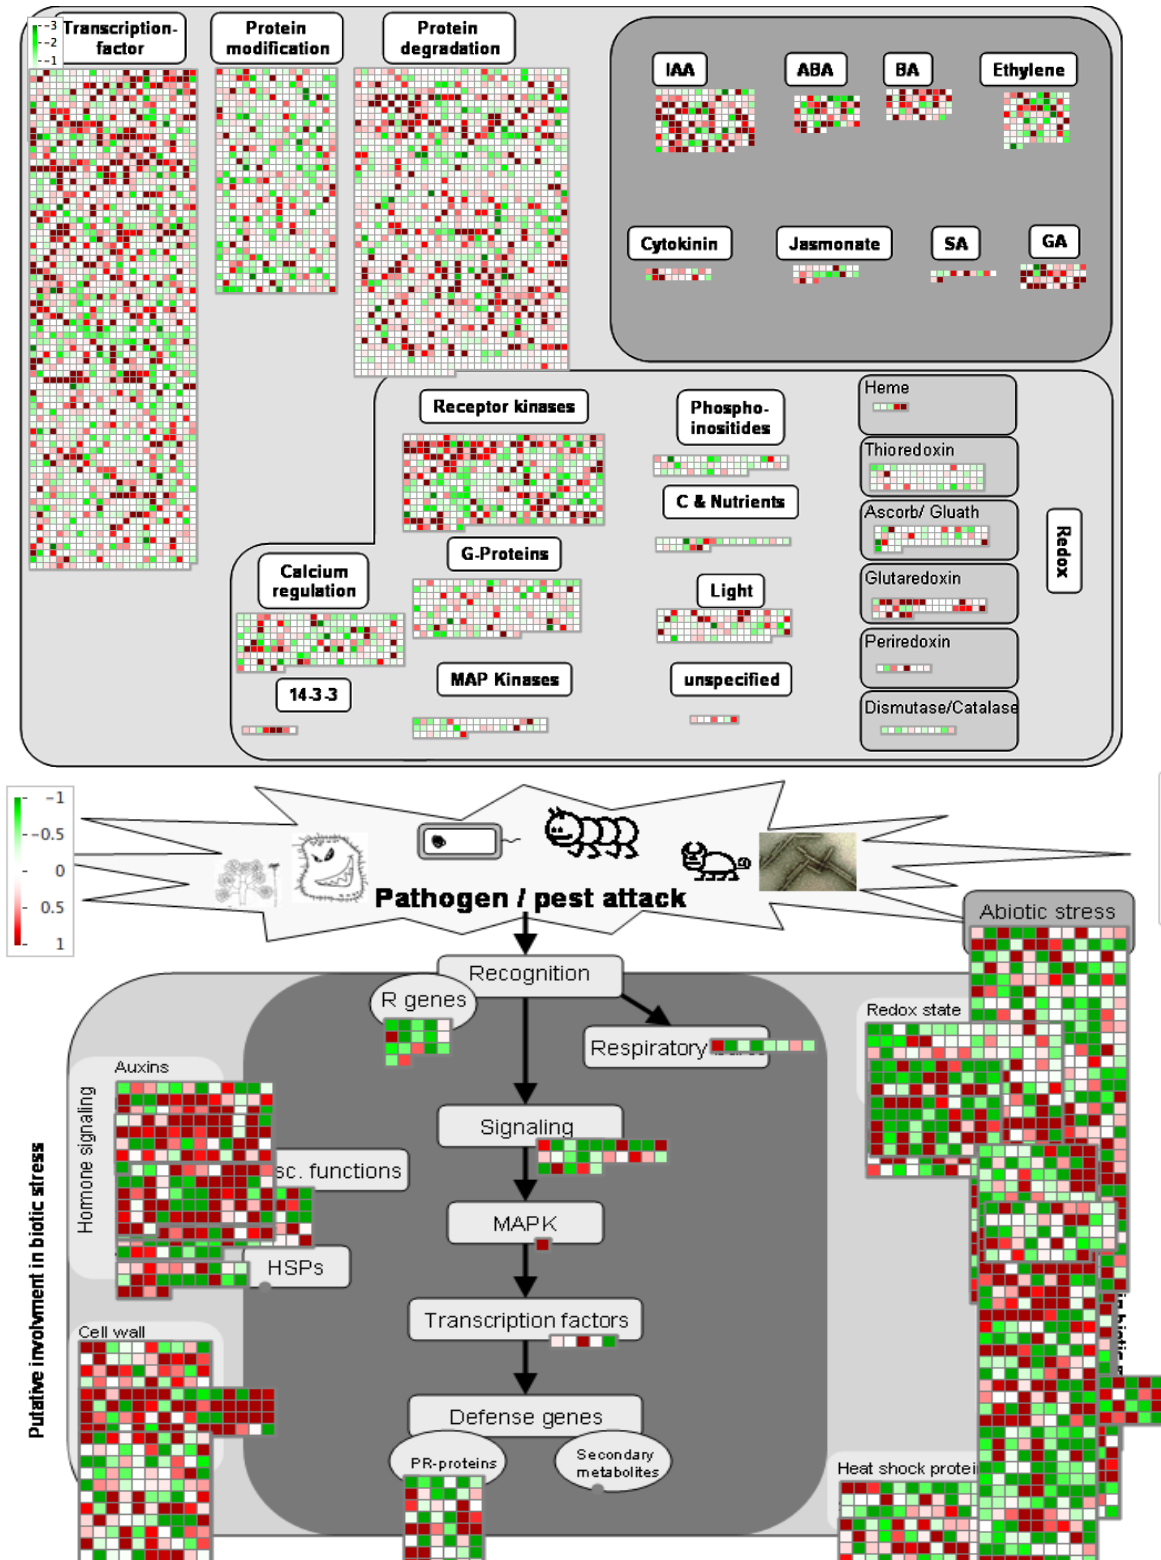

Supplementary figure 5: Genomic DNA PCR with NPT2 (Kan^R) primers for confirmation of MaRAP2-4 transformation in *Arabidopsis*

Supplementary figure 6

Supplementary figure 6: The Scatter Plot shows a 2-D scatter of differentially regulated probes for fold change >2 and <-2 above of the active entity. The axes of the scatter plot is based on intensity in terms of log to the base 10 in each group. Red colour represents up-regulation and green represents down-regulation. A) RAP2-4OE vs WT under control condition. B) OE-6D-WL vs RAP2-4OE. C) OE-6D-WL vs WT-6D-WL.

Supplementary figure 7

Supplementary figure 7: Normalized log₂ expression values for up- and down-regulated genes of MaRAP2-4 vs WT under control condition are plotted onto boxes corresponding to their putative functional annotation using Mapman 3.6. Color intensity reflects the extent of increase in expression level, with more intense color (red- up-regulation, green- down-regulation) means more up- or down-regulation.

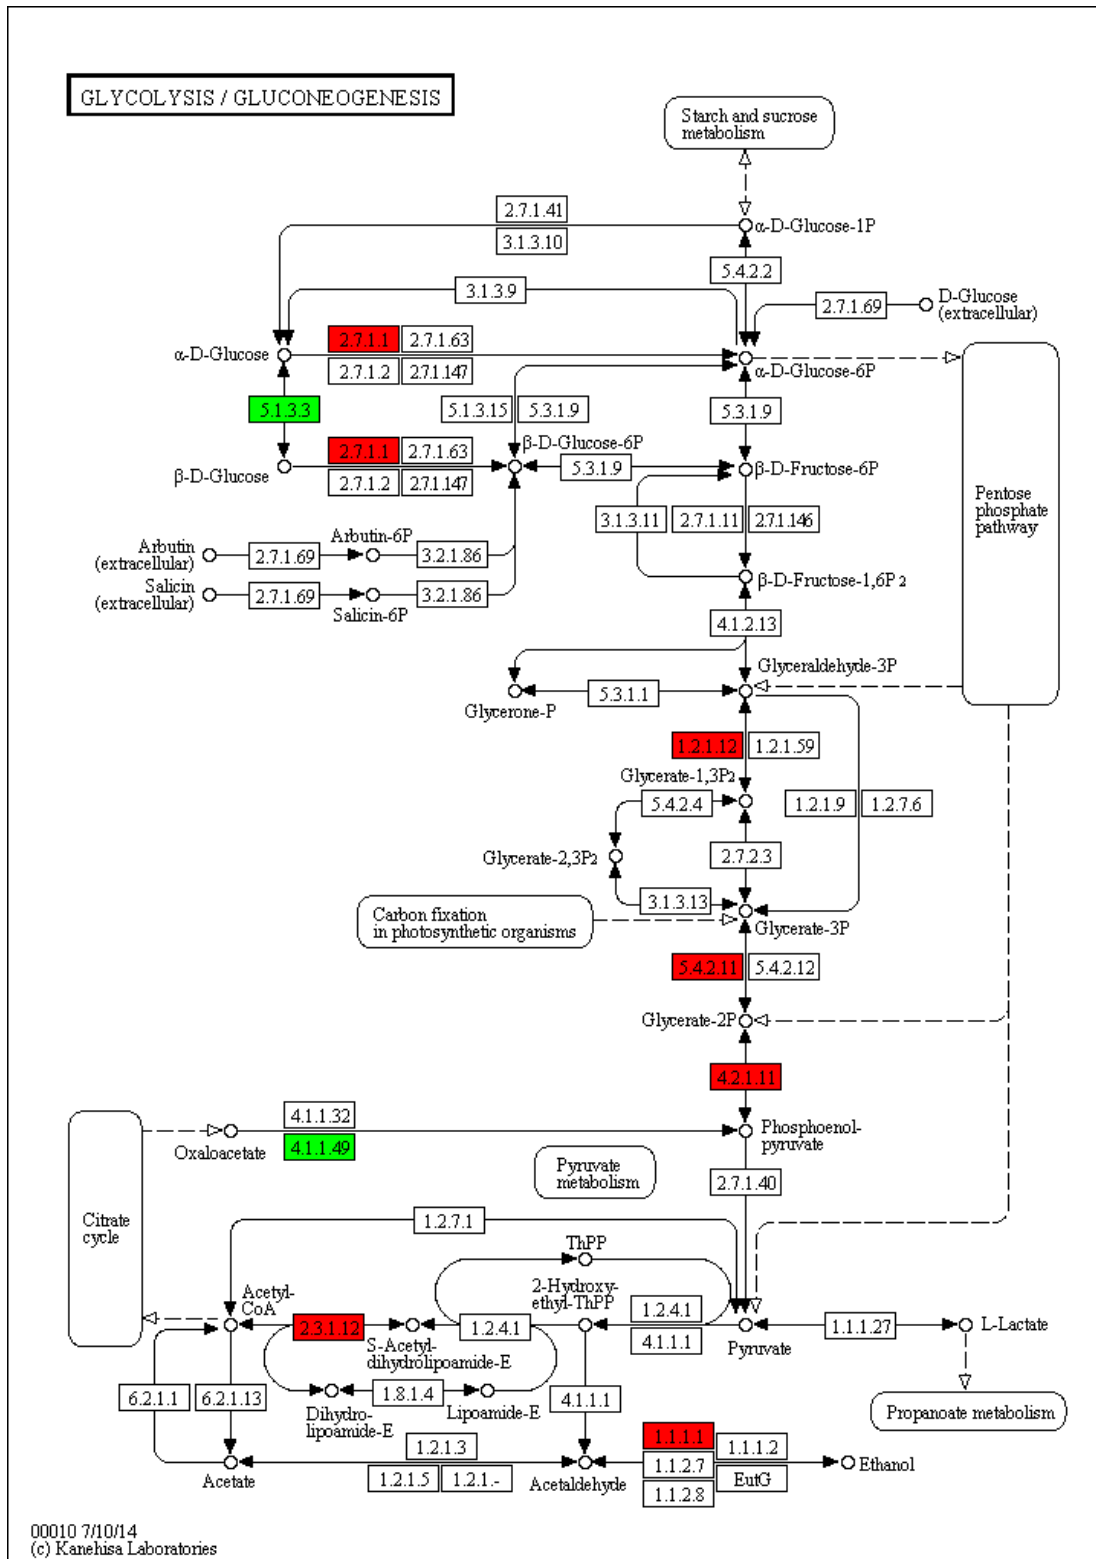

Supplementary figure 8

Arabidopsis thaliana Sweet 10 promoter- 9.34 fold

Supplementary material & methods

Microarray preparation and analysis

Total RNA was isolated from control and 6 days waterlogged *Arabidopsis* whole plants (both OE lines and WT) by QIAGEN RNeasy^(R) Plant Mini Kit. The yield and RNA purity were measured by NanodropND 2000 and Bioanalyser. The mRNA from control and treated roots was used as probe against Arabidopsis_GXP_4x44K AMADID slide. RNA labeling and single microarray hybridization involved 2 technical replicates. Each oligonucleotide was randomly replicated and printed on the array. Briefly, 0.5 µg of total RNA was amplified by the Agilent's Quick-Amp labeling Kit (p/n5190-0442) and labeled with Cy3-CTP. T7 promoter based-linear amplification method was used to generate labeled complementary RNA for One-Color Microarray-Based Gene Expression Analysis. In total, 0.825 µg Cy-labeled cRNA was fragmented to an average size of about 50–100 nucleotides by incubation with fragmentation buffer (Agilent Technologies) at 60 °C for 30 min. The fragmented labeled cRNA was then pooled and hybridized to Arabidopsis_GXP_4x44K AMADID slide with Agilent's In situ Hybridization kit following manufacture's protocol. After washing and blow-drying with a nitrogen gun, microarrays were scanned with Agilent microarray scanner (Agilent Technologies) at 535 nm for Cy3. Scanned images were analyzed by Agilent Feature Extraction Software (v10.7) to quantify signal and background intensity for each feature. The Microarray images were overall clean showing uniform intensity with very low background noise. GeneSpring GX 12.6 Software determined the normalization and statistical significance. In intra array normalization, gProcessed signal (dye normalized background subtracted signal intensity) is log transformed and then for each of the array the 75th percentile value is calculated separately. In each sample the log transformed intensity values for each probe is subtracted by the calculated 75th percentile value of the respective array and expression values are obtained. Fold induction values from both the microarray analysis were normalized to a single fold value. For filtering up-regulation we consider flag should be Detected in the treated sample and can be compromised or Detected in the control samples and Fold ≥ 2 in treated. For filtering down-regulation we consider flag can be Detected or compromised in the treated sample and should be Detected in the control sample and Fold ≤ 2 in treated. *P* values were adjusted for 2 experimental replicates using Student's t-test. Fold induction values from both the microarrays along with their normalized fold induction and adjusted *P* values for individual genes are given in Supplementary material 2, 3 and 4. Responsive genes were classified into functional and pathway categories by DAVID database (Supplementary material 5). The microarray data described in this study have been processed for deposition in Gene Expression Omnibus

with GEO accession number: GSE64070. Microarray expression data were visualized using the Mapman 3.6 software (Thimm *et al.* 2004), and functional bins were identified as being significantly responsive to waterlogging stress. Bins with their name and p-value corrected with Wilcoxon rank sum test are given in Supplementary material 6.

Quantification of total Carbohydrate content

Carbohydrate estimation was done by measuring absorbance at 490 nm by Chow and Landhäusser 2004, Qi *et al.* 2012. For this 200 mg of whole plant tissue was taken; carbohydrates were hydrolyzed and extracted by boiling in 2.5N HCl for 3 hours, cooled to (room temperature) RT and neutralized by Sodium carbonate till the effervescence disappear. Volume was made to 50 ml and to 0.5 ml of the sample added 250 µl of 4% phenol and 1.25 ml 96% Sulphuric acid, mixed properly and OD taken. Standard curve was prepared by diluting 50µg/ml of standard glucose solution.

$$\text{Concentration } \left(\frac{\text{mol}}{\text{g}} \right) = \frac{x(\text{gm})}{\text{Mol. wt } \left(\frac{\text{gm}}{\text{mol}} \right) * \text{weight (gm)}}$$

X (gm) = mass of sugar sample deduced from graph

Mol.wt = mol.wt of monosaccharide/polysaccharide

Weight = fresh weight of the sample

Quantification of total soluble protein

Protein estimation was done by Bradford method using Bradford reagent (CBB G250). Approximately 200 mg tissue was taken and ground finely in 1 ml of extraction buffer (100 mM KPO4 -pH 7.8, 1 mM EDTA, 1% Triton X-100, and 10% glycerol), vortexed for 3 seconds and incubated at room temperature for 30 minutes to extract protein, again vortexed and centrifuged at 5000g for 10 minutes, pellet discarded and supernatant was taken. To 1 ml of sample 5 ml of 1:4 diluted Bradford dye was added and mixed properly and absorbance was taken at 595 nm against blank (dye reagent + NaOH). Protein contents of all the samples were deduced from the standard curve prepared with BSA concentrations 20, 40, 60, 80, 100 and 120 µg/µl.

Quantification of total chlorophyll content

Chlorophyll estimation was performed as described by Vernon (1960). Approximately 100 mg of deveined leaf tissue was taken and ground to a fine paste in 80% chilled acetone and the suspension was subjected to centrifugation at maximum speed for 15 minutes. Pellet discarded and supernatant was taken, final volume was made to 10 ml by 80% chilled acetone. Absorbance was taken at 663 nm and 645 nm wavelengths. Amount of chlorophyll was calculated using following formula

$$\text{Total chlorophyll content} = \frac{(A_{663} \times 8.02) + (A_{645} \times 20.2) \times \text{Total volume}}{\text{Volume of solution used for abs.} \times \text{Gram fresh wt. of tissue taken}}$$

Measurement of Relative Water Content

The relative water content (RWC) was determined as described by Yamasaki and Dillenburg (1999). Leaves were cut from treated plants and their fresh weight (FW) was measured. To determine turgid mass (TM), the leaves were floated in deionized water for 7 hours. Finally, the leaf samples were dried in an oven at 80°C for 48 hours to obtain the dry weight (DW). The RWC was then calculated using the following formula

$$\text{RWC\%} = \frac{(\text{FW} - \text{DW})}{(\text{TM} - \text{DW})} \times 100$$

Measurement of Lipid peroxidation

Lipid peroxidation was analyzed by the thiobarbituric acid test, which determines MDA as an end product of lipid peroxidation (Hodges et al., 1999). For this 50 mg of whole plant tissue was crushed in 1 ml of phosphate buffer pH 7.4, centrifuged at 48°C for 20 minutes, mixed with 500 µl 20% TCA and incubated on ice for 30 minutes. Added 500 µl of 0.65% of TBA and incubated at 95°C for 30 minutes. Centrifuged and absorbance of the supernatant was measured at 532 nm. The MDA concentration was calculated from the extinction coefficient 155 mM⁻¹ cm⁻¹ using the following formula

$$\text{MDA level} = \left[\frac{\text{OD}_{532} \times 100}{1.56} \right] \times \frac{\text{TV}}{[\text{wt} \times 1000]}$$

OD = optical density; TV = total volume of the extract (ml); wt = weight of the leaf tissue (g)

Extraction for antioxidant activity measurement

For assays of the enzymatic cellular antioxidants whole plant samples (0.4–0.8 g) were homogenized in ice-cold extraction buffer (pH 7.5) containing 50 mM 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid (HEPES),

0.4mM ethylenediaminetetraacetic acid (EDTA), 5 mM MgCl₂, 10 % glycerol, 1% polyvinylpyrrolidone (PVP), 2 mM dithiothreitol (DTT), and 1 mM phenyl methyl sulfonyl fluoride (Gegenheimer, 1990). The homogenate was centrifuged (14,000 g) at 4 °C for 20 min. The supernatant was assayed for enzyme activity.

Quantification of Catalase activity

Catalase assay was done as described by Sinha (1972). The extract (0.5 ml) was added to the reaction mixture containing 1 ml of 0.01 M phosphate buffer (pH 7.0), 0.5 ml of 0.2 M H₂O₂, 0.4 ml H₂O and incubated for different time period. Reaction was terminated by adding the 2 ml of acid reagent (5% K₂Cr₂O₇ with glacial acetic acid in 1:3 ratios). To the control, the enzyme was added after the addition of acid reagent. Tubes were heated for 10 minutes and absorbance was recorded at 610 nm. Catalase activity was expressed in terms of – Enzyme unit (EU) of H₂O₂ consumed/min/mg FW using following formula

$$\frac{\Delta C}{min} = \frac{\Delta A}{min} \times \frac{1}{pathlength} \times \frac{1}{extinction\ coefficient}$$

Quantification of SOD activity

Total **SOD activity** was assayed according to Das et al. (2000). The 3 ml reaction mixture contained 50 mM potassium phosphate buffer (pH 7.8), 13 mM methionine, 75 mM NBT, 2 mM riboflavin, 0.1 mM EDTA, and 100 µl enzyme extract. Reaction mixture was illuminated for 15 minutes at a light intensity of 5000 lx. One unit of SOD activity was defined as the amount of enzyme required to cause 50 % inhibition of the reduction of NBT as monitored at 560 nm.

$$\% \text{ Scavenging} = \frac{\text{Absorbance control} - \text{Absorbance sample}}{\text{Absorbance control}} \times 100$$

Quantification of GPx activity

GPx activity was measured according to the procedure of Rotruck et al. (1973) with some modifications. The reaction mixture consisting of 0.4 ml of 0.4 M sodium phosphate buffer (pH 7.0), 0.1 ml of 10 mM NaN₃, 0.2 ml of 4 mM reduced glutathione, 0.1 ml of 2.5 mM H₂O₂, 0.2 ml of water and 0.5 ml of enzyme was incubated at 0, 30, 60, 90 seconds respectively. Reaction was terminated with 0.5 ml of 10% TCA and after centrifugation; 2 ml of the supernatant was added to 3 ml of phosphate buffer and 1ml of DTNB reagent (0.04% DTNB in 1% sodium citrate). The color developed was read at 412 nm and the enzyme activity is expressed in terms of EU of glutathione utilized/min/mg FW using the following formula

$$\frac{\Delta C}{min} = \frac{\Delta A}{min} \times \frac{1}{pathlength} \times \frac{1}{extinction\ coefficient}$$

DPPH radical scavenging assay

For DPPH radical scavenging activity aliquots of extracts were made to total volume of 3 ml using methanol. 0.15 ml of freshly prepared DPPH solution (98 μ g/ml) was added, stirred and left to stand at RT for 30 minutes in dark. The control contains only DPPH solution in methanol while methanol served as the blank (negative control). The reduction capability of DPPH radical was determined by the decrease in its absorbance at 517 nm (Patel et al., 2011).

$$\% \text{ Scavenging} = \frac{\text{Absorbance control} - \text{Absorbance sample}}{\text{Absorbance control}} \times 100$$

FRAP assay

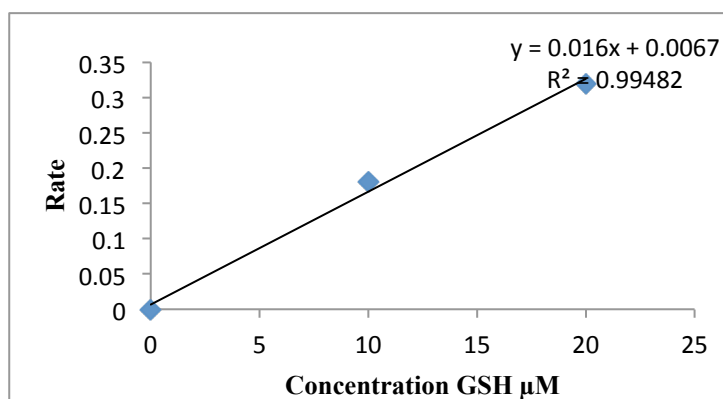

Total antioxidant activity by FRAP assay was done according to Benzie and Strain (1996). 1.5 ml of freshly prepared FRAP solution, containing 25 ml of 300 mM acetate buffer pH 3.6, 2.5 ml of 10 mM TPTZ in 40 mM HCl, and 2.5 ml of 20 mM FeCl₃•6H₂O solution, was mixed with 1ml of extracts, and absorbance was read at 593 nm. The standard curve was linear between 100 and 500 μ M FeSO₄•7H₂O. Results are expressed in μ g Fe(II)/mg FW plant material and compared with that of ascorbic acid.

Quantification of GSH

For Estimation of GSH Boyne and Ellman (1972) method was applied. 1ml of the sample extract was treated with 4 ml of metaphosphoric acid precipitating solution (1.67 g of glacial metaphosphoric acid, 0.2 g EDTA and 30 g NaCl in 100 ml water). After centrifugation, 2.0 ml of the protein-free supernatant was mixed with 0.2 ml of 0.4 M Na₂HPO₄ and 1 ml of DTNB reagent (40 mg DTNB in 100 ml of aqueous 1% Na₃C₆H₅O₇).

Absorbance was read at 412 nm within 2 minutes. GSH concentration was expressed as $\mu\text{g}/\text{mg}$ FW using following formula using standard graph

Quantification of NO scavenging activity

50 μl of test sample previously dissolved in DMSO was added to 200 μl of 10 mM Sodium Nitroprusside and incubated at room temperature for 2 hours. From it 50 μl of the sample was taken and to it added 100 μl of Griess reagent (1 part of the 0.1 % Naphthalene Diamine Dihydrochloride in water and 1 part 1% sulphanilamide in 5% concentrated phosphoric acid). The absorbance of chromophore formed was measured at 546 nm on UV-visible spectrometer (Patel et al. 2011). NO scavenging was calculated using following formula:

$$\% \text{ Scavenging} = \frac{\text{Absorbance control} - \text{Absorbance sample}}{\text{Absorbance control}} \times 100$$
