33

34 **Supplementary Text S1: Calculation of individual-specific and category-specific daily distinct**
 35 **CPIs and cumulative duration of CPIs**

36 The *number of daily distinct CPIs* (DDC) for individual i on day t was calculated according to the
 37 following formula:

38
$$(1) DDC(i, t) = \sum_{j \in H(t)} I(i, j, t)$$

39 Where t is a day of presence of individual i in the hospital, and $H(t)$ is the ensemble of all individuals
 40 present in the hospital on day t and $I(i, j, t)$ is defined by:

41
$$I(i, j, t) = \begin{cases} 0, & \text{if no CPI recorded between } i \text{ and } j \text{ on day } t \\ 1, & \text{if at least one recorded CPI between } i \text{ and } j \text{ on day } t \end{cases}$$

42 The *daily cumulative duration of CPIs* of two individuals i and j on day t is noted $DCD(i, j, t)$ and is
43 calculated as the sum of all CPI durations shared by i and j on day t .

44 The *number of category-specific daily distinct CPIs* (cDDC) depicted in Fig. 2A was calculated
45 according to the following formula:

46
$$(2) \forall c, cDDC(c) = \frac{1}{N_c} \sum_{i \in c} \frac{1}{D_i} \sum_{t=1}^{D_i} DDC(i, t)$$

47 Where c is the category (eg. HCW, patients, etc.), N_c is the number of individuals i belonging to category
48 c , D_i the number of days of presence of individual i in the hospital and $DDC(i, t)$, the number of daily
49 distinct CPIs on day t for individual i .

50 The *category-specific cumulative duration of CPIs* (cDCD) depicted in Fig. 2B was calculated as
51 follows:

52
$$(3) \forall c, cDCD(c) = \frac{1}{N_c} \sum_{i \in c} \frac{1}{D_i} \sum_{t=1}^{D_i} \sum_{j \in H(t)} DCD(i, j, t)$$

53

54 Where c is the category (eg. HCW, patients, etc.), N_c is the number of individuals i belonging to
55 category c , D_i the number of days of presence of individual i in the hospital, $H(t)$ is the ensemble of
56 all individuals present in the hospital on day t , and $DCD(i, j, t)$ the cumulative duration of CPIs on
57 day t between individuals i and j .

58

59

60 **Supplementary Text S2: Calculation of contact frequency and contact duration matrices**

61 For each ward w , the contact matrix depicts the CPI frequency for all individuals of the ward according
62 to their category. The values depicted in Fig. 3 are calculated as follows:

63
$$(4) \forall (w, c_1, c_2), wDDC(c_1, c_2) = \frac{1}{N_{w,c_1}} \sum_{i=1}^{N_{w,c_1}} \frac{1}{D_i} \sum_{t=1}^{D_i} \sum_{j=1}^{N_{c_2}} I(i, j, t)$$

64 Where c_1 and c_2 are two categories, w is the ward number, N_{w,c_1} is the number of individuals s
65 belonging to category c_1 (staff categories or patients), an D_i is the number of days of presence of
66 individual i in the hospital, N_{c_2} is the number of individuals from category c_2 in the hospital, and
67 $I(i, j, t)$ equals 1 if at least one contact was recorded between i and j on day t and 0 otherwise.

68 For each ward w , the contact duration for a given category and a given ward depicted in Fig. 4 was
69 calculated:

70

71
$$(5) \forall (w, c_1, c_2), wDCD(c_1, c_2) = \frac{1}{N_{w,c_1}} \sum_{i=1}^{N_{w,c_1}} \frac{1}{D_i} \sum_{t=1}^{D_i} \sum_{j=1}^{N_{c_2}} DCD(i, j, t)$$

72

73 Where c_1 and c_2 are two categories, w is the ward number, N_{w,c_1} is the number of individuals s
74 belonging to category c_1 (staff categories or patients), an D_i is the number of days of presence of

75 individual i in the hospital, N_{c2} is the number of individuals from category c_2 in the hospital, and
 76 $DCD(i,j,t)$ is the *daily cumulative duration of CPIs* of two individuals i and j on day t .

77

78 **Supplementary Text S3: Calculation of the threshold used for the GLMM**

79
$$(6) M_w = \frac{1}{N} \sum_{p=1}^N \frac{1}{Nd_p} \sum_{k=1}^{Nd_p} C_k^p$$

80 Where N individuals included in the study. Nd_p the number of days for which contacts were recorded
 81 for individual present (indicator or presence in the hospital), C_k^p is the number of distinct CPI (or
 82 cumulative duration with other individual) recorded for individual p on day k .

83

84 **Supplementary Text S4: description of the generalized linear mixed-effects models (GLMM)**
 85 **equations**

86 The GLMM model of the high daily contact frequency and high daily cumulative duration among
 87 hospital staff was calculated:

88
$$(7) Y_{among\ hospital\ staff} = (\beta_0 + \beta_{ward}) + \beta_1 Category + \beta_2 days\ of\ week$$

89 Where $Y_{among\ hospital\ staff}$ represent the high daily contact frequency or the high daily cumulative
 90 duration. β_{ward} represents the ward specific random intercepts, β_1 and β_2 the fixed effect of the
 91 category and days of week as follows.

92 The GLMM model of the high daily contact frequency and high daily cumulative duration among patient
 93 was calculated as:

94
$$(8) Y_{among\ patient} = (\beta_0 + \beta_{ward}) + \beta_1 Reasons\ for\ hospitalization + \beta_2 Age +$$

 95
$$\beta_3 Gender + \beta_4 days\ of\ week$$

96 Where $Y_{among\ patient}$ represent the high daily contact frequency or the high daily cumulative duration.
 97 β_{ward} represents the ward specific random intercepts and $\beta_1, \beta_2, \beta_3$ and β_4 the fixed effect of the
 98 reasons for hospitalization, age, gender and days of week.

99

100 **Supplementary Table S3: sensitivity analysis of the generalized linear mixed-effects models with**
 101 **different thresholds (mean, mean + 1 standard deviation (SD), mean + 2 SD and mean + 3SD).**

102 Factors associated with high daily distinct CPI frequency and high daily cumulative duration of CPIs
 103 among hospital staff or patients, resulting from a mixed model with ward-specific random intercepts to
 104 account for within-ward and between-ward variations.
