Supplementary Data

Part 1. Oligonucleotides.

Sequences (from 5' to 3'), extinction coefficient (ϵ) values expressed in $M^{-1}.cm^{-1}$

Unlabeled DNA:

ds26 (ϵ : 235200): CAATCGGATCGAATTCGATCCGATTG (*self-complementary sequence*)

TG5T (ϵ : 67900): TGGGGGT

PAGE TWJ-S1 (ϵ : 131900): CGGAACGGCACTCG

PAGE TWJ-S2 (ϵ : 135200): CGAGTGCAGCGTGG

PAGE TWJ-S3 (ϵ : 118700): CCACGCTCGTTCCG

Labeled DNA:

fam-TWJ-tamra (ϵ : 435500): *fam*-ACTCTTCTCG-TTTTTT-CGAGAGCGAC-TTTTTT-GTCGCAGAGT-*tamra*

Preparation of the oligonucleotide stock solutions. The lyophilized strands are firstly diluted in deionized water (18.2 $M\Omega.cm$ resistivity) at 500 μ M for monomolecular and bimolecular DNA constitutive strands and at 1000 μ M for trimolecular and tetramolecular DNA constitutive strands. The actual concentration of stock solutions is determined by a dilution to 1 μ M theoretical concentration and a UV-Vis spectra analysis at 260nm (after 5min at 90°C) using the molar extinction coefficient values provided by the manufacturer (*vide supra*).

Preparation of the DNA structures. All DNA structures are prepared in a Caco.K buffer, comprised of 10mM lithium cacodylate buffer (pH 7.2) plus 10mM KCl/90mM LiCl. Monomolecular structures are prepared by mixing the constitutive strand (40 μ L at 500 μ M) with lithium cacodylate buffer solution (8 μ L, 100mM, pH 7.2), plus KCl/LiCl solution (8 μ L, 100mM/900mM) and water (24 μ L). Bimolecular structures are prepared by mixing each of the two constitutive strands (40 μ L, 500 μ M) with lithium cacodylate buffer solution (16 μ L, 100mM, pH 7.2), plus KCl/LiCl solution (16 μ L, 100mM/900mM) and water (48 μ L). Tetramolecular structures are prepared by mixing each of the four constitutive strands

(20 μ L, 1000 μ M) with lithium cacodylate buffer solution (32 μ L, 100mM, pH 7.2), plus KCl/LiCl solution (32 μ L, 100mM/900mM) and water (96 μ L). The final concentrations are theoretically of 250, 125 and 83.3 μ M for mono-, bi- and tetra-molecular DNA structures respectively. The actual concentration of each DNA is determined via a dilution to 1 μ M theoretical concentration (expressed in motif concentration) for monomolecular structure (i.e. 4 μ L in 996 μ L water), at 1 μ M for bimolecular structure (i.e. 8 μ L in 992 μ L water) and at 0.2 μ M for tetramolecular structure (i.e. 2.4 μ L in 997.6 μ L water), via UV-Vis spectra analysis at 260nm (after 5min at 90 $^{\circ}$ C, baseline correction at 390nm), using the molar extinction coefficient values indicated above.

The high-order DNA structures were folded according to two distinct procedures: i- for the intramolecular architectures, the solutions are heated at 90 $^{\circ}$ C for 5min, cooled in ice for 7h, and then stored at least overnight at 4 $^{\circ}$ C; ii- for the intermolecular structures, the solutions are heated at 90 $^{\circ}$ C for 5min, cooled at 80 $^{\circ}$ C for 10min, 60 $^{\circ}$ C for 30min, 40 $^{\circ}$ C for 30min, 25 $^{\circ}$ C for 4h and then stored at least overnight at 4 $^{\circ}$ C.

Part 2. Gel electrophoresis.

Figure S1. Native PAGE analysis (20% polyacrylamide, 1xTBE, 4 $^{\circ}$ C, 1.5hrs, fluorescent visualization (λ_{ex} = 254nm) after post-staining (10min, 25 $^{\circ}$ C) with SYBR[®] Safe) of the three-way junction assembling properties of a panel of 9,10-BisAN-O (left panel) and 1,5-BisNP-O (right panel).

Nondenaturing polyacrylamide gel electrophoresis was carried out with 20% polyacrylamide (AA)-bisacrylamide (BAA) (29:1) gel (including a 6% AA-BAA stacking gel). The “running” gel was prepared as follows: 1.89mL H₂O, 2.5mL AA-BAA (40%), 0.5mL TB 10X, 50 μ L MgCl₂ followed by 50 μ L APS

(100mg/mL) and 15 μ L TEMED prior to use (5mL final volume); the “stacking” gel was prepared as follows: 1.45mL H₂O, 300 μ L AA-BAA (40%), 0.2mL TB 10X, 20 μ L MgCl₂ followed by 20 μ L APS (100mg/mL) and 15 μ L TEMED prior to use (2mL final volume). DNA samples (TWJ-S1, TWJ-S2 and TWJ-S3) and ligands (9,10-BisAN-O and 1,5-BisNP-O) were prepared as 25 μ M solutions; DNA/ligand mixtures were prepared prior to use in 20 μ L (final volume) of 1xTB buffer + 10mM MgCl₂ as follows: TWJ-S1 (4 μ L) + buffer (16 μ L); TWJ-S1 (4 μ L) + TWJ-S2 (4 μ L) + buffer (12 μ L); TWJ-S1 (4 μ L) + TWJ-S2 (4 μ L) + TWJ-S3 (4 μ L) + buffer (8 μ L); TWJ-S1 (4 μ L) + TWJ-S2 (4 μ L) + TWJ-S3 (4 μ L) + ligand (4 μ L) + buffer (4 μ L). Mixtures were gently stirred for 1h30 at room temperature before being loaded on the gel: samples were prepared mixing 15 μ L of the previously prepared DNA samples (\pm ligands) and 3 μ L of sucrose (15% in H₂O; w/v). Prior to the migration, gel is submitted to a pre-treatment at 180V for 1.5hr at 4°C. After loading, the electrophoretic migration was performed in 1xTB (tris-borate buffer), pH 8.3, for 1.5hr at 4°C (180V). After the migration, gels were analyzed after a post-staining step (SYBR® Safe solution, 1:10000, 10mn, 25°C under gentle agitation) with a UVP MultiDoc-It® imaging system (λ_{ex} = 254nm).

Part 3. FRET-melting experiments.

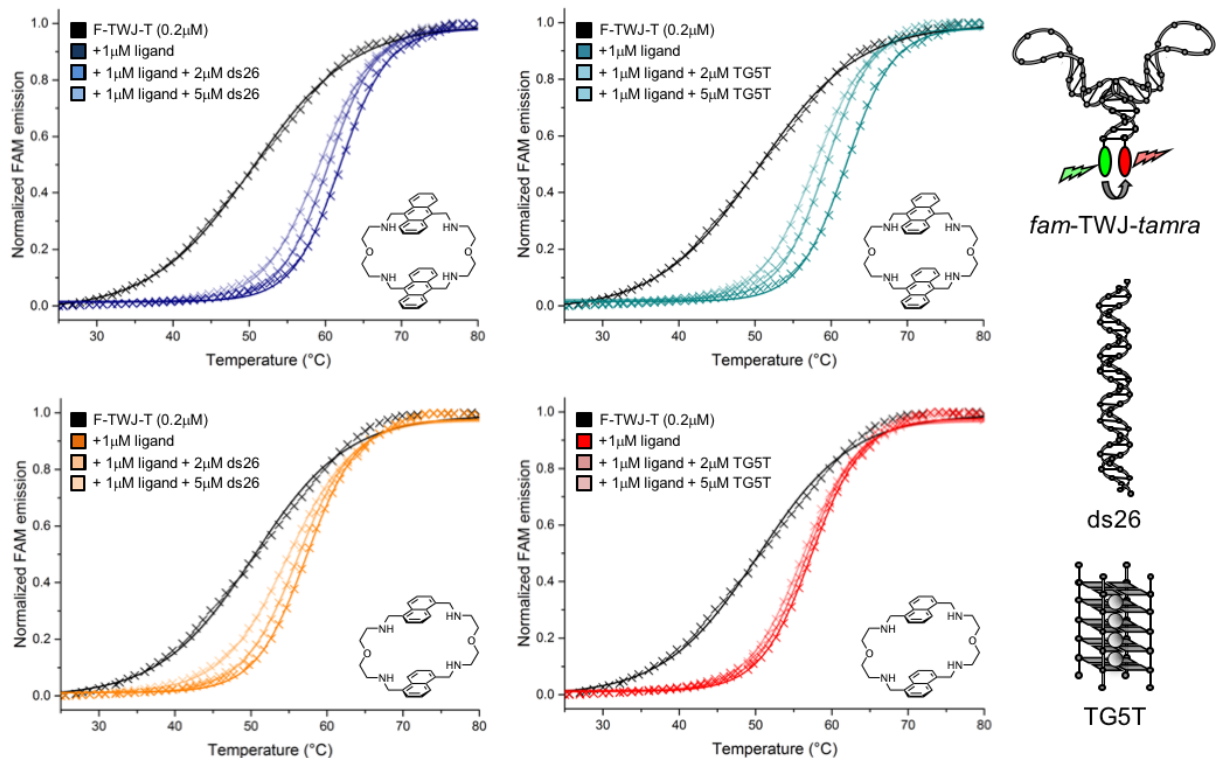

Figure S2. FRET-melting experiments performed with 9,10-BisAN-O (upper panels) and 1,5-BisNP-O (lower panels) with *fam-TWJ-tamra* (F-TWJ-T), in absence of presence of competitors, either ds26 (left panels) or TG5T (right panels).

Experiments were performed in a 96-well format using a Mx3005P qPCR machine (Agilent) equipped with a FAM filter (λ_{ex} = 492nm; λ_{em} = 516nm). Experiments were carried out in 100 μ L (final volume) of

10mM lithium cacodylate buffer (pH 7.2) + 99mM LiCl/1mM KCl, with 0.2 μ M of labeled DNA and 1.0 μ M (5equiv.) of ligands (9,10-BisAN-O and 1,5-BisNP-O). Competitive experiments were carried out in 100 μ L (final volume) of 10mM lithium cacodylate buffer (pH 7.2) + 99mM LiCl/1mM KCl, with labeled DNA (0.2 μ M), ligands (1.0 μ M) and increasing amounts (0, 10 and 25equiv.) of unlabeled competitors (ds26 or TG5T). After a first equilibration step (25°C, 30s), a stepwise increase of 1°C every 30s for 65 cycles to reach 90°C was performed, and measurements were made after each cycle. Final data were analyzed with Excel (Microsoft Corp.) and OriginPro®8 (OriginLab Corp.). The emission of *fam* was normalized (0 to 1), and $T_{1/2}$ was defined as the temperature for which the normalized emission is 0.5; $\Delta T_{1/2}$ values are means of 2 to 4 experiments.

	1 μ M	ds26 competitor				TG5T competitor			
		+2 μ M	^{FRET}S	+5 μ M	^{FRET}S	+2 μ M	^{FRET}S	+5 μ M	^{FRET}S
9,10-BisAN-O	11.3°C	9.7°C	0.86	8.5°C	0.75	8.6°C	0.76	7.2°C	0.64
1,5-BisNP-O	7.0°C	6.0°C	0.85	4.6°C	0.66	6.5°C	0.93	5.9°C	0.84

Table S1. FRET-melting results (expressed as $\Delta T_{1/2}$ values, in °C) of experiments performed with 9,10-BisAN-O and 1,5-BisNP-O with *fam*-TWJ-*tamra* (F-TWJ-T), in absence of presence of competitors, either ds26 or TG5T.

$$^{FRET}S \text{ is calculated as follows: } ^{FRET}S = \Delta T_{1/2[+ligand+competitor]} / \Delta T_{1/2[+ligand]}$$
