**Figure S1.** UV-visible spectra monitored at 720 nm after the addition of 10 equiv. pyridinium triflate to 1.0 mM [Tp\*Mo<sup>IV</sup>OCl(NCCH<sub>3</sub>)] (**2**) in acetonitrile at 10 °C as a control experiment.

**Figure S2** The Eyring plot for the conversion of 1.0 mM [Tp\*Mo<sup>IV</sup>OCl(OPMe<sub>3</sub>)] (**1**) to **2** in CH<sub>3</sub>CN in the presence of 10 equiv. 3-bromopyridinium tosylate. Temperature range: -30 to 0°C.  $\Delta H^\ddagger = 68(2)$  kJ/mol.  $\Delta S^\ddagger = -14(7)$  J/mol. Error bars show one standard deviation from at least three independent measurements.

### Computational results for non-competitive I<sub>a</sub> pathways in the absence of HPyr<sup>+</sup>

An acetonitrile molecule can approach the molybdenum atom from the octahedral face formed by the chlorine and two Tp\* nitrogen atoms, denoted as the I<sub>a</sub>-NNCl pathway (Figure S3). The relaxed scan calculations showed that decrease of the distance between the acetonitrile molecule and the central molybdenum atom leads to the gradual lengthening and eventual dissociation of the Mo-Cl bond. The  $\Delta G^\ddagger$  for this process was found to be ~12 kJ/mol higher than that for the I<sub>a</sub>-NNO pathway presented in Figure 6. For this reason of higher activation energy, as well as the lack of the experimentally observed products associated with this pathway, we conclude that this reaction pathway does not play a major role in the solvolysis of **1**.

**Figure S3.** The I<sub>a</sub>-NNCl mechanism that leads to the side products.

We also investigated the reaction pathway in which an acetonitrile molecule approaches the molybdenum atom from the octahedral face formed by two Tp\* nitrogen atoms and the oxygen atom of the Mo=O moiety, denoted as the I<sub>a</sub>-NNOxo route (Figure

S4). This direction of MeCN attacking led to the dissociation of one of the Tp\*–Mo bonds. Due to the high energetic cost of more than 100 kJ/mol (estimated using relaxed

scan along the MeCN···Mo bond), this reaction channel was not further considered in this study.

**Figure S4.** An illustration of the direction of CH<sub>3</sub>CN attack in the I<sub>a</sub>-NNOxo mechanism.

As one of the Mo–N bonds in complex **1** is significantly longer than the other two Mo–N bonds (i.e. 2.5 vs 2.2 Å), we evaluated the bond energy of this weak bond and found that its dissociation requires 61 kJ/mol, which is significantly lower than the activation energy needed for the dissociation of the Mo–OPMe<sub>3</sub> bond. Accordingly, we inspected if such a formation of penta-coordinated Mo complex might be involved in facilitating the formation of the final products. We found that dissociation of the Me<sub>3</sub>PO–Mo bond in the complex shown in Scheme S1 (denoted as the I<sub>a</sub>-penta route) leads to the formation of the less stable product ( $\Delta H = 104$  kJ/mol,  $\Delta G = 104$  kJ/mol), as compared with the initial pre-reaction complex. Therefore, this pathway is expected to be noncompetitive with the dominant I<sub>a</sub>-NNO mechanism shown in Figure 6.

**Scheme S1.**

**Figure S5.** Electronic energy profiles for the dissociation of the MeCN $\cdots$ Mo bond in  $[\text{Tp}^*\text{MoOCl}(\text{MeCN})]$  (A),  $\text{Me}_3\text{PO}\cdots\text{Mo}$  bond in  $[\text{Tp}^*\text{MoOCl}(\text{Me}_3\text{PO})]$  (B), and  $\text{HPyr}^+\cdots\text{O}(\text{PMe}_3)$  bond in  $[\text{Tp}^*\text{MoOCl}(\text{Me}_3\text{PO})(\text{HPyr}^+)]$  (C), calculated using the relaxing scan technique at the M06L/def2-SV(P)+PCM(MeCN) level of theory.

### Computational details for alternative mechanisms in which $\text{HPyr}^+$ binds to the oxo ligand

**Figure S6.** Alternative  $I_a$  mechanism in which  $\text{HPyr}^+$  is coordinated to the oxygen atom of the oxo ligand.

**Figure S7.** Alternative I<sub>a</sub> mechanism in which HPyr<sup>+</sup> is coordinated to the oxygen atom of the Mo=O moiety.

## Archive entries from the calculation files

The archive entries, formerly intended for the Browse Quantum Chemistry Database System, are organized as a simple list of data fields separated by backslash symbols, which is wrapped in 70-char text lines. The script 'Parse.Archive.pl', written in Perl, converts archive entry into human readable format. To use this script,

1. Check if Perl interpreter is installed on the system. To do this, run the command 'perl -v' in console. If console returns a message like 'command not found', please obtain and install a Perl interpreter ([www.perl.org/get.html](http://www.perl.org/get.html)); Perl is Open Source software licensed under GNU GPL).
2. Save the script code, listed below, as a file named 'Parse.Archive.pl'.
3. Select an archive entry of interest and save it as another file (e.g. 'B-Xb.txt').
4. Run the command 'perl Parse.Archive.pl B-Xb.txt > B-Xb-parsed.txt' in console. The parsed archive entry will be stored in the file 'B-Xb-parsed.txt' in this example. In some cases, absolute path to the Perl interpreter might need to be provided.

```
# --- Parse.Archive.pl ---

# Merge all strings in one line
my $s='';
while (<>) {chomp;$s .= $_}
$_ = $s;

# Some PDF viewers (like Mac OS's Preview) might substitute
# 'end of line' symbols by the white space symbols,
# To remove these extra white spaces, please uncomment the following lines:
# my $str_length = 70;
# my $index = $str_length;
# while (length($_) > $index) {
#     substr $_,$index,1,'';
#     $index += $str_length;
# }

# Replace all backslashes by new-line symbols
s:\\:\n:g;

# Print the resulting output
print;

# --- END ---
```

## Dissociative pathways
